Bill Cheek will recall this from the old days on Fido. :-) I also had a
similar experience. I connect a cheap R.S. wideband preamp between my
antenna and my RG-6. For the first time ever I was able to receive MILSAT
communications. Preamps may not work but without it I can't hear MILSATS
with my present setup. Is this called the placebo effect B.C.? :-)

Good meat and spuds though Bill and Bill. Maybe some of us will learn
something despite it all.

Glenn

NO, you only asked of for ONE. If I am wrong, please re-post that
original
post to prove & I will verify thru Dejanews.

I know you can't do this because you never did request 2, "but have
have fun trying"!!

Also, upon YOU coming forward with your REAL identity, I will comply
with your request of more post(s). I have asked this SEVERAL
time already & you skirt/avoid the issue every time!! (What are
you afraid of???)

> You seem so amused by the word 'fool'. Why is that?

Because it describes you so well!

> If you graduated high school, would you know how to spell 'restaurant'?

Obviously you know NOTHING about geography. It depends on where
you are from!

> It's not spam until you meet the original challenge. Post another one and you
> will have met it. Good luck.

See again, "upon YOU coming forward with your REAL identity, I will
comply
with your request of more post(s). I have asked this SEVERAL
time already & you skirt/avoid the issue every time!! (What are
you afraid of???)"

Nope, the best place to address the problem is in e-mail, where you can address the person and find out what their problem is, rather than starting an off-topic thread. By the way, how did you get your box to start typing in lower case? I'd like to have a set of instructions handy, for the next time I ask a webTVer to turn off their caps and get yet another dumb response like "GEE, TOO BAD I DON'T HAVE A DOUBLE-CAPS KEY TO SHOW YOU... [an actual response]"

Nice to know you found your CAPS lock key, Shirley. =) Seriously though, can we end this thread? I think we can all come to the consensus that those who hate all WebTV users are going to continue doing so for some time, even finding petty faults like misspelled words to bolster their little jabs. And likewise, WebTV (just like AOL) is probably going to stick around for quite some time. If you've got something against any user here, then maybe you should take it to e-mail. The way things are going here, you'd think users of "legitimate" ISPs never learned how to use e-mail... and I thought it was the WebTVers who were the "morons?"

The type of service you're talking about is usually handled by AirTouch paging (http://www.airtouch.com), and it's called the ESPN sports pager. Basically, a set of additional cap codes are programmed into the pager as "news slots," and when scores become available, they get sent out as a group page that shows up in this slot, separate from your personal pages. PageNet has a similar service, but they broadcast news headlines and financial information, primarily. The only way to get this service specifically is to switch paging carriers and to sign up with Airtouch or PageNet, since the caps are sent out on their frequencies only. This might be to your advantage, too, since there's word that AT&T is trying to sell their paging services division (which, judging from the pager address, you gave, is what you're using.

Source record: 178826

- - - - - ARIZONA SCANNER LISTENERS - - - - -

Southwest Frequency Directory's brand new 4th Edition (1998-1999 edition) is now available! The new scanner frequency and information resource will be in Phoenix and Tucson stores next week. This book is made in Arizona by local scanner "experts", for Arizona. SWFD is NOT just another national database printout...

SWFD-4 includes frequencies, radio codes, fire station resources, general public safety agency information, terminology, abbreviations, and more for Police, Fire, and Medical services. In addition, frequencies for Aircraft, Amateur Radio, Media, Hotels & Resorts, Schools, Malls, Security Companies, Utilities, and local and federal government are also included. SWFD-4 is over 300 pages, in an easy to use 8 1/2" by 5 1/2" size, with a coil bind, NOT a spiral bind like other books. By using only COIL binds, SWFD allows its users to flip pages all the way over and keep the book open to one page only, with only that page showing. This makes looking things up and programming your scanner much easier. New this edition is added line, borders, page breaks, and cardstock section seperators to make finding what you are looking for quick and easy. Also included in the 4th Edition of the Southwest Frequency Directory is talkgroup numbers for Motorola TRUNKED Radio Systems throughout the Phoenix Valley, for use with Uniden's TRUNKTRACKER scanners. With the release of the TrunkTracker scanner, a quality frequency directory like SWFD has never been more important.

Although the book will sell for between $25 and $30 in stores beginning next week, you can order yours directly from Southwest Frequency Directory today for $25 for the first copy, and $20 for each additional, and this price includes shipping.

Don't miss out! SWFD-4 promises to be the best and most up-to-date frequency directory there is for Arizona!

Send a check or money order to:
Southwest Frequency Directory
5816 N. Camino Arturo
Tucson, AZ 85718-2904

Please feel free to e-mail questions to SWFD's editor at DanR@azstarnet.com

Thanks,

Dan Rollman / KC7ANQ
SWFD - Editor

The City of Kingman is LEASING a TRS on 861-865.4875, and 861-865.7375. You can give those a shot. You may also want to see if they are using Ch3 (the other repeater chanell) as primary now for some reason or something similar on the same band.

Why not give yourself and your family a very useful, practical, and
inexpensive
gift this Christmas?

The new KENWOOD FreeTalk FRS PERSONAL POCKET 2-WAY RADIO
(www.kenwood.net/freetalk)
DOES NOT require an FCC license (or test of any kind) to operate, and,
best of all,
there are NO AIRTIME or other monthly charges or fees associated with
the use of
this great radio! That's right...AIRTIME IS FREE!

Check out the FreeTalk's features and specs:

* Small Compact Size (4"x2.2"x1") Easily fits into shirt pocket or
purse!
* Very Lightweight - Only 6.3 Oz * Also comes with sturdy belt clip
* Large Easy to Ready LCD Channel/Mode Display * Fold-Away Swivel
Antenna
* 14 User Selectable Channels * 38 User Selectable CTCSS "Privacy" Tones
* Speech Scrambling - for that extra measure of privacy not found on
other brands
* 38+ Hours of Use on 3 AA batteries (not included) * Full Kenwood
Warranty
* Available in Hi-Viz/Sport Yellow or Cobalt Black
* 1 to 2 Mile Range - perfect for biking, hiking, back-packing,
cross-country
skiing, camping, fishing, vehicle-to-vehicle caravans, keeping tabs on
the
kids at the mall.....also great tool for use in small
business/office/warehouse
applications or parking lot traffic control....security....safety

The Kenwood FreeTalk FRS Personal Pocket Radios are on sale for only
$249.95 a pair at

Quality MobileCommunications (800) 808-9839 M-F 8-5 PST
INCLUDING UPS Ground Shipping to any place in the USA!
(UPS Blue, Red or FedEx Overnight also available at add'l cost)

* Optional Accessories include a Voice Activated VOX Headset ($59.95), a
lapel-
worn Speaker Microphone ($44.95) and a clip-on Microphone with
Earphone ($29.95)

Order your pair now to avoid the Holiday Rush!
Please allow 7-10 working days for delivery.
(VISA/MasterCard orders only, please - sorry, NO COD's)

(Suggested Retail Price of each unit is $160.00 - Our Single Unit Price is $ 139.95)

I may not be reading you right, but why a crystal for PL in an Expo? Why
not just add a tone board? 30 bucks or so and fairly easy. It's what I
did.
```

> never seen a truly wide band amp from them.

It is the Archer Cat No. 15-1117 10db COAXIAL IN-LINE AMPLIFIER 5-900 Mhz.
Noise:
5-400 6db max
400-900 6.5db max

What other specs you want Bill? They sell these things as TV amps. Now the one I have is about 8 years old. The last time I was in a R.S. store (6 months ago) they were back with the TV goodies.

Yea, I know it has a pretty high noise figures but it brought the MILSATS from zero to weak and 100% copy. I don't have the technical savvy that you do but I do know what works and doesn't work for me.

Glenn

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?" This article answers the question in various sections:

Books
Magazines
Government Records
Web Sites
Federal Radio Stations
Radio Clubs
Do Your Own Sleuthing
What Makes Station Identification Difficult?
Examine the FCC License on Premise
Examine the Labels on Radio Equipment
Equipment to Determine Frequency Usage
How Can I Determine To Whom I'm Listening? - An Example
Summary
Addresses

Books

The most convenient source of fire and police frequencies is the Police Call Plus, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $13. Police Call Plus is

basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. A few pages of local airport and nonsensitive federal government frequencies are included. Selected business frequencies are listed, too, but without callsigns and other details.

I highly recommend Richard Barnett's 1992 book, Monitor America, published by Scanner Master Corp. A 3rd edition is available from Grove Enterprises for about $30. It is crammed full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the Radio Communications Monitoring Association (RCMA), now defunt. Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call Plus, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The longstanding source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good

book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and the sensationalistic Popular Communications magazines.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $49 instead.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100.

The PerCon Spectrum CDROM sells for under $30 and contains a handful of fields for every FCC license in the US. However, Public Safety license information contained in the Winter 1996 Spectrum doesn't appear as up to date as in the 1997 Police Call Plus.

Spectrum works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Web Sites

If you have access to the World Wide Web, you can visit dozens of sites with local frequency lists. You can look | up civilian aero frequencies for specific airports at: | http://www.airnav.com/airports/.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret

Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available on the WWW page http://aosc.rpmdp.com and from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio

room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are

mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the

instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities

to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

FAQ library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

This introduction is intended for people new to the
scanning hobby and is oriented to scanning in the USA.
High level overviews of the following topics are presented:

Why Scanning?
Is Scanning Legal?
What Scanner Should I Buy?
What is a CTCSS and DCS Tone Squelch Feature?
How Do I Determine the Proper CTCSS or DCS Code?
Scanner Antennas
Coaxial Cable Feedlines
Where Can I Buy A Scanner?
Modifying Your Scanner
Scanner Repair Shops
Where Can I Obtain Frequency Information?
Do Your Own Frequency Detective Work
How Can I Use Equipment to Uncover New Frequencies?
Scanner Clubs and Mailing Lists

Why Scanning?

Every day and night, scanner hobbyists are entertained by
what they overhear on their radios. Police cars, fire
engines, ambulances, airplanes, armored cars, trains,

taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies.

It is illegal for companies to sell or import into the USA recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

The rules define "readily altered by the user" as "clipping the leads of, or installing, a simple component such as a diode, resistor and/or jumper wire; replacing a plug-in semiconductor chip; or programming a semiconductor chip

using special access codes or an external device, such as a personal computer."

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations and the AR5000 works well.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. Beware of low cost programmables which can't search. Some of the newer models, like the Uniden SportCat and Radio Shack PRO-2046, allow searching between limits, but the limits are factory programmed and cannot be altered.

Get a model which covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 50 channel scanner will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate. The $2000 Icom R8500 and AOR AR5000 models are exceptions.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, BC230XLT, and Radio Shack PRO-43 and PRO-60 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Looking for value? At $180 discount price, the 100 channel Uniden/Bearcat BC860XLT base is a good value and available at most Wal-Mart stores. The RELM HS200 portable performs very well is an excellent value at its $250 street price.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-64 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

CTCSS and DCS Tone Squelch Feature

Upscale scanners can be optioned with a subaudible tone decoding squelch circuit. There are two types: CTCSS (Continuous Tone Coded Squelch System) and DCS (Digital Coded Squelch). In simple terms, this feature lets your scanner ignore signals you don't want to hear.

Most land mobile two way radios, except trunked systems, transmit either CTCSS or DCS signals subaudibly along with the voice information. U.S. military field radios employ wider deviation and a 150 Hz CTCSS tone, not supported by most scanners or CTCSS decoders.

There are over 40 different CTCSS codes and you can program a specific CTCSS or DCS code into each memory channel. Using a CTCSS or DCS decoder permits your scanner to open the squelch only if the transmission has a code which matches the code you program.

CTCSS and DCS decoding offers several advantages:

1. Ignore unwanted signals on shared frequencies: It is common for several users to share the same frequency, e.g., my county sheriff uses the same frequency as Chicago Police, located about 60 miles away. I want to hear my sheriff's transmissions but don't want the scanner to stop on or listen to Chicago Police transmissions. This is especially a problem when radio propagation is good, e.g., during a "band opening," when reception range is temporarily increased.

2. Combat intermodulation interference: Helps keep out intermod and image interference from strong pagers and other signals which are not transmitted with a matching code.

3. Ignore scrambled transmissions: Many federal law enforcement agencies (FBI, Secret Service, etc) and some local police agencies employ digital voice scrambling, which sounds like white noise and is annoying to hear. The CTCSS or DCS code is sent only when the station is transmitting unscrambled, or "in the clear." You can program federal frequencies along with the proper code into your decoder-equipped scanner so you won't have to listen to the scrambled mess and only hear their transmissions when they are unscrambled.

CTCSS also goes by various tradenames: Motorola's PL (Private Line), GE's Channel Guard, and RCA's Quiet Channel. Motorola uses the tradename DPL (Digital Private Line) for its digital coded squelch.

How Do I Determine the Proper CTCSS or DCS Code?

There are a few ways to determine the CTCSS or DCS code transmitted by a station:

1. Use an outboard CTCSS/DCS reader which must be attached to the discriminator output circuitry inside the scanner. The reader has an LCD or LED display which indicates the code when a station transmits. I use a CSI model CD-1 Communications Decoder Unit, an an excellent reader which sells new for about $200. (Connect Systems Inc., Ventura, CA, 800-545-1349, www.connectsystems.com).
2. Many of the ScannerMaster guides, as well as scanner club newsletters, print the CTCSS codes used by transmitting stations.
3. On some scanners equipped with the CTCSS squelch, you can program into memory the frequency of interest. Then you "tune" slowly through all the different CTCSS and/or DCS codes until the squelch opens and you hear the dispatcher talking. This is a slow process and the station has to keep transmitting during it.
4. A slow, brute force method is to program the same frequency but a different CTCSS code into several channels and see where your scanner stops.
5. In some cases, I've actually examined the walkie-talkies I want to monitor and found the CTCSS code printed on a label on or inside the radio.

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer these alternative antennas for use with portable scanners:

1. The Icom FA-1433B dual band flex antenna, a thin and very flexible rubber antenna, is slightly longer than a stock heliflex but provides better performance.
2. The Austin Condor is a 12" long rubberized antenna available for about $30. While considerably longer than the stock antenna and the FA-1443B, the Condor is very flexible and provides VHF-high band reception superior to both. It is not designed to cover the VHF-low band, but will allow reception there at least as good as shorter antennas.
3. The "Thin-Stick" is an 18 inch telescoping antenna for extended range. It is made in USA by Smiley Antenna

Co., Inc. and is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 50 miles or more, depending on terrain. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U, e.g., Belden type 8267, has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Be sure it is on sale, as Radio Shack list prices are high and their scanners are offered at reduced prices by mail order discounters.

Discount chain stores like Wal-Mart, Best Buy, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove.net

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411. Web page is www.aesham.com

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then

copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

For information on "virtual downconverter" modifications, see Steve Donnell's article in January 1995 RCMA Scanner Journal or February 1996 Monitoring Times. Reprints of articles from Monitoring Times are available for $3.00 each plus a self-addressed stamped envelope from:

Grove Enterprises,
7540 Highway 64 West,
Brasstown,
NC 28902. For a free catalog, call (704)837-9200.
Telephone (orders only): (800)438-8155.

I don't get any part of this reprint fee.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (www.iinc.com/ggcomm or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Repair tips for Bearcat and Radio Shack scanners are discussed in two other FAQ articles.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call Plus, published each year in 9 regional volumes by Hollins

Radio Data, and sold at Radio Shack and larger book stores. The newest editions contain abbreviated business listings, too, although callsigns and other details are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200, www.grove.net) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning (NatScan) is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency

lists are often found in club publications, not commercial magazines, and are discussed later.

The Scanner Club is the name of a bimonthly magazine published by Les Mattson. It is a successor to the Northeast Scanning News and is the official publication of The Scanner Club, a not-for-profit club organization. TSC's main strength is local frequency information, including CTCSS codes. Sample issues are $4 each. A yearly membership costs $24.95 and includes 6 issues. Write to The Scanner Club, PO Box 62, Gibbstown, NJ 08027 for more information.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the

transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $5.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation.

This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Peter Laws administers an electronic mail list read by over 700 hobbyists devoted to scanners and scanning. It's called "scan-l" and for more information, read:

http://www.wildstar.net/~plaws/scan/scan-l.txt

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages

long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. You can obtain an electronic subscription to the CARMA Newsletter. For more info, see:

http://www.TheRamp.net/shabec/carma.htm

The club's mailing address is:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (630)852-1292.

All meetings are held on Saturdays at locations announced in advance. Meetings are usually held at:

- the Destiny Restaurant, on Rand Road, in Des Plaines,

- Philly's in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook,

- The Great Escape, on Irving Park Road, Schiller Park

and at other restaurants.

REPAIR TIPS: RADIO SHACK SCANNER RADIOS

Copyright 1997 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

Radio Shack has been selling scanners and monitor receivers
under the Realistic and Radio Shack labels for over 30
years. Most of them were manufactured by General Research
Electronics of Tokyo, though many newer models are
manufactured by Uniden.

The date of manufacture is usually printed on a gummed
label on the scanner as well as the cardboard box. A code
of 12A5, means the scanner was made in the 12th month of
1975, 1985, or 1995, for example.

There's another way to date Radio Shack scanners
manufactured by Uniden. The first digit of the long serial
number is usually the last digit of the year of
manufacture.

Another way to roughly estimate a radio's age is to examine
the 4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most
recent date stamp.

Schematics, Owner's Manuals, and Parts Available

Service manuals for most Radio Shack scanners may be ordered through your local Radio Shack store.

If Radio Shack doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

Parts lists for recent models are available on line at: http://support.tandy.com/support_electronics/2849.html. Parts may be ordered through Tandy National Parts, telephone (800)442-2425 or (817)870-5600, or through your local Radio Shack store

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

GRE-Built Base Models: Dim Backlight

The backlight in many base models, including the PRO-2022, PRO-2004, and PRO-2005/6 is implemented by an electroluminescent panel, which grows dim with use.

The EL panel used in the PRO-2005 and PRO-2006 is designated EL-501, and is identified by Radio Shack part #10800050. A new EL panel can be ordered through your Tandy National parts (see above) or local Radio Shack store and sent to your home. Radio Shack no longer sells replacement EL panels for the PRO-2004.

Replacing the backlight is an operation which requires care and patience. Purchase a service manual, and study the exploded parts diagrams as you read the following steps.

Top and bottom cabinet pieces must be removed, then the speaker unplugged from the main board. The front panel assembly must be removed from the chassis by removing 4 flat head screws, 2 on each side. You need not disconnect all the wiring harnesses, though you might have to unplug one so it won't get in the way of a hot soldering iron.

Unsolder the bare ground wire soldered to a large shield on the back of the front panel, located near the back of the squelch control. Two ground braids must be temporarily disconnected by removing the screws which fasten them to the chassis. After removing the volume and squelch knobs, you must remove 8 small screws which fasten the plastic front panel to the diplay board.

The old EL panel is fastened by a bead of glue and two foil type leads soldered to the display board. It's easier to cut the two leads from the old EL panel before unsoldering. A sharp knife should be used cut away the glue. The old EL panel can then be slid gently out from behind the LCD display.

The new EL panel can be installed by reversing the process, though I found that it is not necessary to glue the new panel. The two foil leads must be soldered using a minimum of heat. Reassemble the pieces in reverse order of disassembly.

GRE-Built Portables: Worn Out Keypads

The keypad on late model GRE-made Radio Shack portables, e.g., PRO-39 and PRO-43, can become unreliable after prolonged use. The best repair is to replace the rubber keypad instead of trying to restore contacts using chemicals. A replacement rubber keypad may be ordered inexpensively through Tandy National Parts or your local Radio Shack Store.

PRO-43: Loss of Audio

Early PRO-43s were built with a 200 mW speaker (mfr's part #EAS-3P123A). The voice coils in some of these speakers have opened, resulting in lack of audio output, though audio is still available from the earphone jack. A more capable 500 mW speaker is available through Tandy as replacement (EAS-3P127).

PRO-43: Freezup

If you attempt to lock out all 20 channels in a memory bank, then scan only that bank, your PRO-43 will freeze up and be placed into a catatonic state. Use the procedure documented in the PRO-43 user manual to fully reset the scanner. This will "break the trance," but all the memory channels will be cleared.

PRO-2004: Dead

If your PRO-2004 is completely dead, check R235, a 1 ohm, 1 watt resistor mounted vertically on the main board.

Add a Plectron or Motorola Alert
Desktop Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their crystal controlled, transistor Plectron and Motorola desktop monitor receivers. They have now been replaced by battery operated portable pagers, and the desktop models are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They are desktop models which can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

Models and Frequency Coverage

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. For example, low band R8000s come in 30 - 35, 35 - 39, 39 - 49, and 49 - 54 MHz versions. There are two VHF high band versions of the R8000: 148 - 158 and 158 - 175 MHz.

VHF-low band Motorola Alert monitors come in two splits: 30 - 42 and 42 - 54 MHz.

Although UHF versions of the 700 series were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The 8000 series were even newer and very desireable, but they are difficult to find at hamfests. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The R8000 series are much smaller than the P1 and R700 and are housed in metal cabinets of various colors. The R8000s use the same MC3357 IF/detector/squelch IC used in crystal scanners, but their crystals are not interchangeable with ordinary scanners. R8000s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
30-54 R8190 R8150

148-174 R8200 R8160

Table 3. Plectron 8000 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Minimum Volume Setting

Both Plectron and Motorola Alert monitor receivers are designed purposely to have a minimum volume setting which is still audible. The intent was to prevent firemen from turning the volume down completely, forgetting it was down, then missing an important call.

This "feature" was usually implemented by having a fixed value resistor in series between one end of the volume control and ground. In the R15X5, R14X5, R15X5, and R16X5, a 47 ohm resistor, designated R624, was inserted in series with the violet wire leading from the volume control.

You could decrease the lowest volume setting by decreasing the value of this fixed resistor. Alternatively, you could replace the resistor with a jumper wire to completely silence the receiver at minimum setting of the volume control.

Tone Alert Feature

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain.

Repair and Replacement Parts

Repair service and replacement parts for the Plectron P1 and R700 models is offered by:

Weber Electronics
PO Box 212
5138 Laurel Ln.
Broad Run, VA 20137
telephone (540) 347-7760

You can also obtain Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

Plectron SM-series Scanning Receivers

Plectron also sold an SM series of scanners, manufactured in Japan by the same folks who made Craig (division of Pioneer) scanners. The SM series are consumer-grade models and are included in this article for the sake of completeness. They are crystal controlled radios and

feature priority scan and a separate trimmer capacitor for
each channel to net the crystals on frequency.

Band Frequency Limits

VHF-low 30 - 50
VHF-high 150 - 174
UHF 450 - 470 MHz

Table 4. Plectron SM Model Band Limits

Model UHF VHF-high VHF-low

SM-301 X X X
SM-302 X X
SM-303 X X
SM-304 X X

Table 5. Plectron SM Models

The crystals used in the SM series are quite different from
the crystals used in the conventional single channel
Plectron monitors. Here are the crystal formulas:

VHF low band:
crystal 3rd overtone freq = receive freq + 10.7 MHz

VHF high band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz)/3

UHF band:
crystal 3rd overtone freq = (receive freq - 10.7 MHz) /
10

Other crystal specifications for the SM series are:

CR 25/U holder
3rd overtone
20 pF load capacitance
parallel resonant
max series resistance 40 ohm
max drive 2 mW

I currently have no Plectrons or Motorola Alert Monitors
for sale. I'm hoarding them. :-)

BUYING A USED SCANNER RADIO

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET groups
rec.radio.scanner, alt.radio.scanner, and rec.radio.info.
It is also available electronically from the
rec.radio.scanner ftp archive on the official USENET FAQ
library ftp://rtfm.mit.edu/pub/usenet-by-
group/rec.radio.scanner.]

Abstract

This article discusses the purchase of used scanner radios
and includes these topics:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase
most of my receivers at hamfests or horsetrade with other

radio hobbyists.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Radio Shack repairs scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Electra's Jolly Roger, and GE's Surveyor series (see US patent 4,011,515, granted 3/8/77). Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 (see US patent 3,961,261, granted 6/1/76), Bearcat BC-101 (see US patent 4,179,662, granted 8/4/78), and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. See US patent 4,057,760, granted 11/8/77. The GRE-manufactured SBE Optiscan (and its Sears clone) required poking or covering a series of holes in

plastic cards which were then inserted into a slot on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to

cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229
Phone 317-894-3229

Crystals for Bearcat and other models are available from:

American Crystal Co.
1623 Central Ave.
Kansas City, KS 66102
tel. 913-342-5493

Bomar Crystal Company

group/rec.radio.scanner.]

Abstract

This article contains product review summaries for more than
70 old and new scanner radios and monitor receivers.

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. This article
describes a few of the FM receivers in my collection, and
other models I've tested. It is not meant to be complete.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass,
Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass,
Monitoring Times, May 1995.

I have published full length reviews and modifications of
these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004

Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Feb 1996 - Radio Shack PRO-2042
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jun 1996 - modifications & tips for the Uniden/Bearcat BC9000XLT
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Oct 1996 - Radio Shack PRO-2046 mobile
Dec 1996 - AOR AR5000
Jan 1997 - ICOM R8500
Feb 1997 - Radio Shack PRO-2045
Mar 1997 - ICOM IC-R10
Apr 1997 - RELM HS-200 portable
May 1997 - Uniden/Bearcat BCT7 virtual downconversion mod.
Jul 1997 - Uniden/Bearcat BC235XLT portable Trunktracker
Aug 1997 - Radio Shack PRO-64 portable
Sep 1997 - Stridsberg Engineering receiver multicoupler,
G/Wiz board for EDACS trunked scanning
Oct 1997 - Radio Shack PRO-67
Nov 1997 - Sporty's JD-100 Air Scan
Dec 1997 - Uniden/Bearcat BC985XLT Trunktracker

Note: Reprints of Monitoring Times articles are available for $3.00 each plus a self-addressed stamped envelope from Grove Enterprises, 7540 Highway 64 West, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this reprint fee.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700

Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than any other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise. See "AOR's AR5000 All-in-One Receiver," by Bob Parnass, in Monitoring Times, December 1996, for a review which includes quantitative test results.

ICOM

R-10: late 1996 vintage (serial number 01048 tested). Shirt pocket size multimode is powered by 4 AA penlight cells. Covers 0.5 to 1300 MHz (minus cellular). NFM, WFM, USB, LSB, AM, and CW detectors included. IF bandwidths are fixed. No 30 kHz bandwidth for satellite or FM military monitoring. Battery saver circuit, with selectable duty cycle. Single VFO and 1000 memory channels. There are 900 memory channels divided into 18 banks of 50 channels each. Another bank of 100 channels used to hold unique frequencies found during an auto store operation. 20 pairs of search limits. Up to 100 frequencies may be locked out during a search and stored in a final bank of 100 channels which is cleared before subsequent auto store searches. Each channel can be programmed with the detector mode (e.g., AM, USB), a tuning step size, an attenuator enable flag, and an 8 character label. CI-V computer interface requires extra cost hardware. 7 segment S-meter. Noise blanker. Good sensitivity. Lighted keypad and display, but keystroke sequences are cumbersome.

Good radio hardware in a handy sized package, but scanning performance unimpressive. Very slow memory scanning at only 6 channels/second. Searches at about 16 steps/second, with little or no worthwhile improvement using the "Signal Navigator" feature in the R10 I tested. Rescan delay cannot be disabled. Can only scan one memory bank or all banks, not a combination of banks. No squelch for SSB or CW modes. See "ICOM IC-R10 Receiver," by Bob Parnass, in Monitoring Times, March 1997, for review which includes quantitative test results.

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the ICOM user with a very annoying clickety-clack, clickety-clack! For Baseband Audio out, I mounted an RCA jack on the back of the R7100A and connected it via shielded cable to the junction of resistors R228 and R230 on the Main Unit. This point is located in the vicinity of IC15 and X3 on the schematic.

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band.

Second and third IFs are 10.7 and 0.455 MHz. Weak to moderate cellular images starting near 1106 MHz. Rugged construction. External power supply. DB25 RS232C connector. Audio peak filter. Ok scanning and great searching performance. See "ICOM R8500 Receiver," by Bob Parnass, in Monitoring Times, January 1997, for a review which includes quantitative test results.

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout. See US patents 4,092,594, granted 5/30/78 and 4,114,103, granted 9/12/78 for further insight.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. See US patent 4,270,217, granted May 26, 1981. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good

internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels See US patent 4,270,217, granted May 26, 1981. Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite. See US patent 4,409,688, granted 11/11/83 for further insight.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on

vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor. Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC895XLT TrunkTracker(Uniden): 1997 vintage. Base with 300 channels in 10 banks. Covers military air band, but other frequency coverage is limited compared with the BC9000XLT. Predetermined AM and NFM modes not selectable. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. Weather alert siren. Built-in CTCSS decoder and tone finder. A query feature identifies duplicate memory channels. Test unit scans 85 channels/sec and skips empty channels. Triple conversion, 380.8 or 254.4, 10.85, and 0.45 MHz IFs. 800 MHz images in commercial and military air bands attenuated over 35 dB. For technical test results and a review, see "The Uniden Bearcat BC895XLT," by Bob Parnass, AJ9S, in Monitoring Times, December 1997.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for

each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. For a full review, see "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times. See US patents 4,947,456, granted 8/7/90, 5,163,161, granted 11/10/92 and 5,212,817, granted 5/18/93 for further insights into fast scanning and searching implementation.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC230XLT (Uniden): See BC220XLT.

BC235XLT TrunkTracker(Uniden): 1997 vintage. Portable with 300 channels in 10 banks. Can scan or search in conventional or trunked domains but not at the same time. Scans Motorola Type I, II, IIa 800 MHz trunked systems, but only one trunked system at a time. Programming Type I and IIa systems requires knowing the Fleet Map ahead of time or else using exhaustive trial and error. A query feature identifies duplicate memory channels. Very fast scan and search rates. Scans 64 channels/sec and skips empty channels. Service search. Data skip. Triple conversion,

254.4, 10.85, 0.45 MHz IFs. Excellent image rejection and intermod immunity. Fairly good audio. See "The Uniden Bearcat BC235XLT," by Bob Parnass, AJ9S, in Monitoring Times, July 1997 or an on-line version at www.grove.net for a review which includes quantitative test results.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. NiCd pack provides about 5 hours between charges. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered

different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. See US patent 4,057,760, granted 11/8/77. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate.

Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Z60: base/mobile sporting 60 channels, but 10 of them are for FM broadcast only. Built in alarm clock, priority, and memory which requires no battery backup. Covers 30 - 50, 88 -108, 118-136, 144-174, 440-512 MHz. Notice that it's not spec'd to cover some important federal bands: 136 - 144 and 406 - 440.

RELM

HS200: 1996 vintage. Very good 200 channel portable. 10 banks. Built-in CTCSS and DCS decoder. Lighted keypad. Duplicate channel detection. 100 frequencies can be locked out from search. Very good audio and strong front end. Excellent internal shielding. Global rescan delay. Covers CB. Fixed modes and step sizes. IFs are 280.2 and 0.45 MHz, and perhaps one in between. For a quantitative test report, see "The RELM HS-200 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1997, for a review which includes quantitative test results.

Radio Shack

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound

Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort

memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2045: 1996 vintage. Very good 200 channel base/mobile made for Radio Shack by Uniden. Tuning/channel selector knob. 10 banks, selectable attenuator, and rescan delay. CTCSS-capable with optional board. Great Auto Store. Weather alert. Scans and searches fast. Can lock out 50 frequencies during search. Step sizes fixed but AM and NFM modes are selectable. IFs are 380.7, 10.7, and 0.455 MHz. Images on VHF-high band despite high 1st IF. Some intermod on review unit. See "The Radio Shack PRO-2045," by Bob Parnass, AJ9S, in Monitoring Times, February 1997, for a review which includes quantitative test results.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996, for a review which includes quantitative test results.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Somewhat prone to intermod in | the 460 MHz range. Cellular images throughout the 847.6 - 869 MHz range. See September 1996 Monitoring Times for * modifications.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in

early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO-64: 1997 vintage. Good portable 400 channel scanner using up conversion. Replaces PRO-62 and has many more features. Selectable AM/NFM modes but fixed step sizes. 10 search banks which can be cascaded. Auto store saves unique frequencies found during a search. Frequencies can be loaded using a computer but optional interface kit not yet available. Can recharge Radio Shack's optional, monolithic NiCd pack, but not AA cells within the scanner. IFs are 257.5, 21.4, and 0.455 MHz. See "The Radio Shack PRO-64," by Bob Parnass, AJ9S, in Monitoring Times, August 1997, for a review which includes quantitative test results.

PRO-67: 1997 vintage. Good portable 200 channel scanner using up conversion. Replaces PRO-51 and has better image rejection and super fast scanning. Service Search lacks police frequencies. Fixed AM/NFM modes and step sizes. Can lock out up to 20 frequencies during a search. Can recharge both Radio Shack's optional, monolithic NiCd pack, and AA cells within the scanner. Frequencies adjacent to the cellular phone bands censored so our PRO-67 will not receive 868.9625 or 823.9625 MHz. Intermediate Frequencies are 254.4, 10.85, and 0.45 MHz. See "The Radio Shack PRO-67," by Bob Parnass, AJ9S, in Monitoring Times, October 1997, for a review which includes quantitative test results.

PRO-30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

SPORTYS

JD-100: 1997 vintage. Limited 20 channel scanner which covers civil and military air bands only. Good audio. Large display shows frequency only out to 2 digits. Slow scanning and odd keystroke sequences. No key press confirmation beep. Cannot lock out channels from memory scan. Powered by AA batteries. Battery saver circuit. See "Sportys JD-100 Air Scan," by Bob Parnass, AJ9S, in Monitoring Times, November 1997.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned

out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X			no
FR105	6	X			no
FR2512	24	X			no
FR2513	24	X			no
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2516	10	X		yes	yes
FR2517	10	X		yes	yes

FR2525 10 X yes yes
FR2526 10 X X yes yes
FR2527 10 X X yes yes
FR2528 10 X X yes yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. See US patents 3,961,261 and 3,962,644, granted 6/1/76 and 6/8/76 respectively. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner

crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including a beautiful 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

RadioMap has been advertised monthly in Monitoring Times magazine since 1995. The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and

wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $24.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $29.95 for standard or $34.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

How to Obtain Copies of Patents

Printed copies of US patents may be purchased for $3 each, but you must know the patent number. Credit card orders are taken over the telephone by the Assistant Commissioner for Patents at (703)305-4350. Alternatively, you can mail a check or money order, made payable to "The Assistant Commissioner for Patents" to

The Assistant Commissioner for Patents
Washington, DC 20231

For more information about the US Patent and Trademark Office, call their automated information message system toll-free at (800)786-9199.

There are various patent servers on the world wide web, including IBM's server:

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1997 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

One way to roughly estimate a radio's age is to examine the
4 digit date codes often stamped on the integrated
circuits. The radio must have been made after the most

recent date stamp.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 11915 E. Washington St., Cumberland, IN 46229. Phone 317-894-3229.

To order a user manual for an Electra/Bearcat scanner from Uniden, call (800)235-3874 extension 2553.

Some schematic diagrams may be obtained from Uniden/Bearcat's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges.

The phone number for repair is (800)297-1023, too. I recommend you call repair before sending the broken scanner. Items for repair via UPS (include receipt if still under warranty) are usually sent to:

Uniden America Corp.
4700 Amon Carter Blvd.
P.O. Box 95002
Fort Worth, TX 76155

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267, http://www.hwsams.com/sams_model_new.html

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal

chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

Jim Craig replaced a 22uF/35V C98 capacitor to repair his | BC210XW. |

Paul Grohe replaced a failed C98 with a low ESR (equivalent series resistance), high frequency, switching regulator grade capacitor, e.g. a Panasonic HF series capacitor. He also recommends adding a 0.1 ceramic capacitor in parallel with C98.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom IC is no longer available from Uniden.

Failure of IC9, the 9 volt NJM78M09A regulator in a BC800XLT is another cause of a blank display.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a

flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the

microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2 NJM386SL) to ground. Capacitor C55 shorted in another BC200XLT. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter, but you must first fix the component which caused Q201 to fail.

BC9000XLT: Loss of Sensitivity

John Ward has fixed two BC9000XLTs which suffered from "low sensitivity." He fixed the solder joint where the antenna jack connects to the circuit board. In both cases the tab from the board was on the opposite side of the jack from where the little blob of solder applied at the factory was located.

It was an intermittent problem that depended upon the position of the antenna cable - if the weight of the cable placed tension on the jack in one direction contact was made and the radio worked fine. If the cable placed tension on the jack in the opposite direction contact was lost and so was reception. The gap was barely noticeable.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd

electrolytic capacitor in series between the external
speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder
connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier
activated relay inside the BC890XLT wore out. Andy found
the identical relay sold at Radio Shack (part #275-232) and
says the BC9000XLT uses the same relay, too.

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1996 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14 of MC3357 (IC1)
Radio Shack PRO-2002	R197	47K try 220K.
Radio Shack PRO-2004	R148	47K remove R148 or replace with 220K.

	On linear board,
	between pins 12 & 14
	of TK10420 (IC2)
Radio Shack PRO-2022	R91 33K replace 33K
	with 220K.
	Between pins 12 & 14
	on IC-1 MC3361
Radio Shack PRO-2035	100K replace 100K
	with 220K.
	Between pins 12 & 14
	of TK10420 (IC-2)
Electra/Bearcat 220	R75 2.7M may be ok as is

Hi Bill,

The BC895XLT I tested worked well except for some cellular
images in the civil and military air bands.

See my BC895XLT test results & review in this month's (12/97)
Monitoring Times. Should be on the newsstands shortly.
Just got my issue last week.

Peel Regional Police are now on the Peel Region trunk system
exclusively. Mississauga Fire have started using it, but still
simulcast on VHF. Don't know about Brampton yet. We're going to need
TrunkTrackers soon to do any real listening in the GTA.

FCC License Data Sources
Bill McFadden
billmc@agora.rdrop.com

Changes preceeded by "|". Please e-mail corrections and additions to me.

INTRODUCTION

This is a list of FCC license data sources available to scanner hobbyists. The FCC master contains a wealth of data about every non-government license in the United States (over three million records). Most of the sources listed contain a subset of this data, although a few contain all or nearly all of it. Government licenses are not administered by the FCC, and the data is not available to the public.

Also available are subscrition services from companies like ISI and CET. Since they charge by the minute, they are not really practical for the hobbyist and hence are not included in this list.

Prices are rounded to the nearest dollar and include shipping, if known.

C.E.T.

CET sells records of all stations inside a 30-mile radius for $80. (Major cities cost extra.) A 70-mile search costs $178. The data is provided on floppy disks and is available in ASCII columnar and comma-delimited formats.

CET does not provide data for licenses that do not contain specific geographic coordinates (i.e., mobile-only systems) or specific operating frequencies (e.g., amateur radio).

To do the search, CET requires the latitude and longitude of the center of the 30-mile radius. I calculated mine from a USGS topographic map I obtained at a local nautical supply store. Alternatively, you can obtain the coordinates for your town from the University of Michigan's geographic name server. Run "telnet 141.212.99.9 3000" and enter your zip code. For my area, the server returned the coordinates of the main post office.

CET can be reached at 800-445-0297.

CSP TECHNOLOGIES

CSP Technologies sells FCC data on CD-ROM. ScannerBase covers the entire US and comes with a database search program.

ScannerBase costs $34. CSP Technologies can be reached at 888-857-4240 (voice) or http://www.csp-tech.com/.

FCC

The database is also available from the FCC for free. It covers most services but not all. Sections can be downloaded, processed with a supplied Visual BASIC program, and viewed with Microsoft Access. The entire database is approximately 3 GB in size. See:

http://www.fcc.gov/oet/info/database/raeddf.html

GROVE

Grove sells FCC data on CD-ROM and floppy. The CD-ROM covers the entire US and is available with or without mapping support. The mapping version brings up a map with the requested station plotted on it. The regular version is $104, and the mapping version is $174.

Floppies are available by state for $44 per state (add $10 for CA, FL, TX). The disk comes with a database search program. Grove Enterprises can be reached at 800-438-8155 (voice) or http://www.grove.net/.

MICROFICHE

The Bearcat Radio Club sells the FCC master by state for $15. Bearcat Radio Club can be reached at P.O. Box 291918, Kettering OH, 45429.

PERCON

PerCon sells FCC data on CD-ROM. The Spectrum CD covers the entire US and comes with a simple database search program. Regional CDs cover subsets of the US but come with a more powerful database manager and provide more detail about each license. Also available is a Ham callsign and repeater database CD.

Spectrum costs $37, and the Ham and Repeater Database is $22. Regional CDs are $137 for the first CD, $102 each additional CD ($560 for the entire 6 CD set). Data is updated twice a year. PerCon can be reached at 716-386-6015 (voice), 716-386-6013 (fax), support@perconcorp.com, or http://www.perconcorp.com. The Spectrum database can be searched free of charge via Percon's WWW page.

POLICE CALL

This is probably the most cost-effective source of public service license information. The detail is limited, but the information that is there is often more useful than the FCC master. For example, an entry in Police Call that reads, "Portland Police, Net 3, North Precinct," reads, "Portland, City of" in the master. Police Call has been merged with its sister publication, Beyond Police Call, and now includes a limited

selection of business listings.

Police call is available in 9 volumes covering different regions of the US. It can be purchased at Radio Shack stores for $13 per volume.

| PRO DATA

| Pro Data is a database manager program for license data. It does not come
| with its own data but can import data from APF, Percon, ScanWare, and
| UFDBF database files.

| Pro Data costs $60. For more information, write to prodata1@gte.net, or
| visit http://home1.gte.net/prodata1/index.htm.

RADIOMAP SERVICE

Developed by long-time Usenet contributor Bob Parnass, this service provides a custom report of frequencies, callsigns, and licensee names for a specified area in any of the 50 states. Coverage areas of 4 to 256 square miles will be chosen by Bob depending on transmitter site density. Standard and deluxe reports are available. Both reports include a color plot with transmitter sites marked. The deluxe report adds a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area.

To create the report, Bob requires the latitude and longitude (or nearest street intersection) of the center location. Standard reports are $29.95, and deluxe reports are $34.95. Write to Bob Parnass at 2350 Douglas Rd, Oswego, IL, 60543, or call him at 630-554-3839 between 6-10 PM central time.

SCANWARE ASSOCIATES

ScanWare Associates has developed a PC-based database program called the FCC Frequency Retrieval System. FCC data for all states is available, covering all services and all frequencies. Current data is for first quarter, 1996.

Scanware has chosen to discontinue developing this software, but the good news is that the software and data are now FREE! It is being hosted by the West Virginia Educational Network. See:
http://www.wvsc.wvnet.edu/~fcc/index.html

APPENDIX

Here is table of data fields in the FCC master. Fields provided by various products are indicated by "#" or the field length, if known.

I was only asked to provide one post so that is all I did provide.

You really ar the group FOOL aren't you!!!!!!!!

If you sit down in a restaurante & order a slice of pie, would
you expect the waiter to bring your 3 or 4 or more pies?? Of
course not. Likewise, I was asked to provide a relevant post
I made on this NG within the last 3 months & I provided
a relevant post as requested. I am NOT going to spam this
newsgroup with multiple replies to only one request.

Perhaps if you would use a little common sense in the
future you could avoid these embarrasing mistakes.

Wrong! Then where did I get your phone numbers, address, age, and the
fact that you have no FCC license? From your Webpage? your signiture
file? When you grow up, get your own place to live, and become an
adult, perhaps you will learn how not to let all that information get
into so many different places. ESPECIALLY if you are going to make so
many enemies and be such a Troll.

This is a terrific all around scanner, even if you don't plan to monitor trunking systems. You can't beat the price (under $300 in most places), for a 300 cps base unit. It performs well, has lots of useful features (autostore and autosort, for examples), and computer control features (although the cable is over priced).

You should check out Rich Wells Scanner FAQ,
http://www.qsl.net/n2mca/NEW_USER.HTM and click on "Picking A
Scanner", then on that page go to the bottom and click on "Dealers
FAQ", many mail order places are listed there, it says what country
they are from and have links for you to check out their web pages. You
don't necessarily have to buy one from Canada, you can also order from
Europe. Check em all out, some are more expensive and some are less.

I'm trying to decide which scanner to buy, the Uniden UBC3000XLT(actually Commtel 216, the European version) or the Yupiteru MVT 7100. The thing that doesn't allow me to decide is that the Yupiteru has the frequencies between 1300Mhz and 1650Mhz while the Uniden only goes up to 1300Mhz, are these frequencies important, would I be missing anything on these frequencies?

>Are you aware that the above USENET newsgroup has been recently created to,
>I would assume, cater to you and others who enjoy this sort of thing?

That group was created more than a year ago by Scott Gufterson (spelling) who along with Hansen, Morrisseau, Cheek and many others were engaged in one of the longest and most raucous flamefests in the history of Usenet. In fact, the old timers refer to those days as the "War of Words, II" which was quite an escalation of the "War of Words, I," I believe. Since I NEVER engage in flaming, caustic remarking, insult-hurling, bombastic blather and those sort of things, I am vague on the details.

The group that was created in honor of Mr. Mackey is alt.fans-john mackey or something similar. Since I am not a fan of his, I have never had occasion to post anything there.

>and the like, over there at alt.radio.scanner.flame_fest and your scanner
>posts,(If you ever make them), over here?

This is good advice. You should follow it.

Dunno if it meets your needs, but Radio Shack is selling the Pro-64 for $199 on sale ($100 off regular price). That's a pretty good deal for that particular scanner.

It's got triple conversion, 400 channels, auto store, 40 monitor memories, blah, blah, blah. You can also drop frequencies into it via computer.

69. Darwin Awards

Newsgroup: rec.radio.scanner
Date: 1997-12-01 00:00:00 UTC
From: pro2042@aol.com
Message-ID: <19971201164400.LAA03541@ladder01.news.aol.com>
Source record: 179039

It is once again time to vote for the Darwin Award nominees for
1997. As you may already know, the Darwin Awards are for those
nominees who will not be contributing to the gene pool or rec.radio.scanner
(thankfully).

The 1997 nominees are:

NOMINEE No.1 [San Jose Mercury News]
An unidentified man, using a shotgun like a club to break a
former girlfriend's windshield, accidentally shot himself to
death when the gun
discharged, blowing a hole in his gut.

NOMINEE No.2 [Kalamazoo Gazette]
James Burns, 34, of Alamo,Mich., was killed in March as he was
trying to
repair what police described as a "farm-type truck." Burns got a
friend to drive the truck on a highway while Burns hung
underneath so that he could ascertain the source of a troubling
noise. Burns' clothes caught on
something, however, and the other man found Burns "wrapped in
the drive
shaft."

NOMINEE No.3 [Hickory Daily Record]
Ken Charles Barger, 47, accidentally shot himself to death in
December in
Newton, N.C., when, awakening to the sound of a ringing telephone
beside
his bed, he reached for the phone but grabbed instead a Smith &
Wesson.38
Special, which discharged when he drew it to his ear.

NOMINEE No.4 [UPI, Toronto]
Police said a lawyer demonstrating the safety of windows in a
downtown Toronto skyscraper crashed through a pane with his
shoulder and plunged 24 floors to his death. A police spokesman
said Garry Hoy, 39, fell into
the courtyard of the Toronto Dominion Bank Tower early Friday
evening as
he was explaining the strength of the building's windows to
visiting law
students. Hoy previously had conducted demonstrations of window
strength
according to police reports. Peter Lawyers, managing partner of
the firm

Holden Day Wilson, told the Toronto Sun newspaper that Hoy was "one of the best and brightest" members of the 200-man association.

NOMINEE No.5 [Bloomburg News Service]
A terrible diet and room with no ventilation are being blamed for the death of a man who was killed by his own gas. There was no mark on his body but autopsy showed large amounts of methane gas in his system. His diet had consisted primarily of beans and cabbage (and a couple of other
things). It was just the right combination of foods. It appears that the
man died in his sleep from breathing the poisonous cloud that was hanging
over his bed. Had he been outside or had his windows been opened, it wouldn't have been fatal. But the man was shut up in his near airtight bedroom. According to the article, "He was a big man with a huge capacity for creating "this deadly gas." Three of the rescuers got sick and one was hospitalized.

NOMINEE No..6 [The News of the Weird.]
Michael Anderson Godwin made News of the Weird posthumously. He had spent
several years awaiting South Carolina's electric chair on a murder conviction before having his sentence reduced to life in prison. Whilst
sitting on a metal toilet in his cell and attempting to fix his small TV
set, he bit into a wire and was electrocuted.

NOMINEE NO.7["The Indianapolis Star"].
A cigarette lighter may have triggered fatal explosion - Dunkirk, Indiana. A Jay County man using a cigarette lighter to check the barrel of a muzzle loader was killed Monday night when the weapon discharged in
his face, sheriff's investigators said. Gregory David Pryor, 19, died in
his parents' rural Dunkirk home about 11:30 p.m. Investigators said Pryor
was cleaning a 54-caliber muzzleloader that had not been firing properly.
He was using the lighter to look into the barrel when the gunpowder ignited.

NOMINEE No.8 [AP, St. Louis]
Robert Puelo, 32, was apparently being disorderly in a St. Louis market.
When the clerk threatened to call police, Puelo grabbed a hot dog, shoved
it in his mouth, and walked out without paying for it. Police found him unconscious in front of the store; paramedics removed

the six-inch wiener
from his throat, where it had choked him to death.
NOMINEE No.9 [Unknown]
To poacher Marino Malerba, who shot a stag standing above him on
an overhanging rock-and was killed instantly when it fell on him.

NOMINEE No.10 [Associated Press, Kincaid, W. VA]
Blasting Cap Explodes in Man's Mouth at Party. A man at a party
popped a
blasting cap into his mouth and bit down, triggering an explosion
that blew off his lips, teeth and tongue, state police said
Wednesday. Jerry Stromyer, 24, of Kincaid, bit the blasting cap
as a prank during a party
late Tuesday night, said Cpl. M.D.Payne. 'Another man had it in
an aquarium,hooked to a battery, and was trying to explode it,"
Payne said.
"It wouldn't go off and this guy said, 'I'll show you how to set
it off."

A simple WWW search with the keyword "pocsag" will find it for you.

NOT meant as a flame but the new members of the internet community should first of all learn how to use a WWW search engine. Another angle on the search issue is to go to http://www.ferretsoft.com/ and get a great little program called WebFerret. It automatically goes out to a bunch of WWW search engines to do your keyword search. I am not connected to these folks other than being a satisfied user.

I for one wonder how many people out there have scanner mods that were only possible due to the efforts of people such as Bill. A lot of people that like to flame him seem to have scanners that are modified, How many are as a result of Bills books. Personaly I have two that are modified only because of his efforts and experimentation. I would say that many owe him big time. So I say thanks Bill for your efforts and keep up the work.

Take a look at http://www.lrz.de/~-/. This site has a POCSAG decoder app and I believe includes docs on building an interface.

>http://www.ferretsoft.com/ and get a great
>little program called WebFerret.

You can also go to www.internic.net and use one of a number of "meta search engines" that do the same thing. I prefer using it to Web Ferret--which is not a bad program by any means--because once you install it, you no longer have the option of using only a single search engine. When I know pretty much what I am looking for, I like to use AltaVista and do a quick search rather than wait for a number of search engine to do their tricks. WebFerret doesn't give you that option--at least I didn't find it...

Howdy,
If you have a satellite dish there are all kinds of scpc(single channel per carrier) channels at 1360-1450 mhz. This is one of the big reasons I bought the 7100. I've never found anything else up on these frequencies but I'm sure there are interesting things if you know where and when to scan.

Michael,
With WebFerret you can go to options and set it to use any number of the
10 search engines available including Alta Vista. Ferret is easier for ME,
I don't have to start a web browser or anything to do a search. Possibly
you had an older version or more likely it is a case of operator error.
;-O

Information on the BC895XLT I/O port and data format |
From: A. Giammarino <agia@ix.netcom.com> |
Last Update: 12-01-1997:1230 hrs |
*** View with a mono-proportional font *** |
------------------------------------------------------
Cable information:

Connectors used: Female DB9
1/2 of an 8 pin DIP socket

Wiring: DB9 Socket
3---------------1 data into radio
2---------------2 data from radio
5---------------3

Pinout on BC895XLT is such that pins 1 & 5 and 2 & 4 are tied together. Pin 3
is GROUND. Plug the cable into a computer serial port and connect the socket
end to the radio. Make sure that whatever wiring convention you use, that the
connections depicted above are maintained (e.g. not reversed, etc...) I have
my socket end of the cable connected to the first three pins closest to the
AUX jack.

============================================================================
Data format:

The BC895XLT communicates at 9600 baud, 8 bits, no parity, 1 stop bit. Using
a shareware scanner program I found on the internet, I monitored the raw data
between the computer and the scanner. That coupled with some guesswork yielded
the following so far:

Note: You will need to put the scanner in the remote mode. Press and hold the
ALRT/RMT button until the radio beeps twice. Also, the scanner is case
sensitive - USE UPPER CASE LETTERS.
```

```
================================================================================
AC: Clears all memory and resets the radio.

AR: status of LINE for AUX OUT
ARN: turns LINE on
ARF: turns LINE off

CC: responds with N - meaning unknown.

CD: CTCSS search function. Causes CTCSS in display to flash. Responded with 23
when it found a PL of 146.2.
CDN: function on
CDF: function off

CS: responds CSxx; xx two digit number representing CTCSS tone
CSxx: sets CTCSS tone xx (e.g. xx=11 for 97.4 Hz)

CT: CTCSS function - works just like DELAY above.
CTN: function on
CTF: function off

DL: responds with status of DELAY function - N for on, F for off
DLN: turns DELAY on
DLF: turns DELAY off

DS: unknown, responds NG

IC: unknown, responds NG

ID: Turns on/off trunk ID number being sent to data port while trunk tracking.
IDN: Sends ID number to port.
Format is: ID s nnnnnn; s=S while receiving, s=E at end of
transmission. nnnnnn=trunk ID number.
IDF: turns function off.

IL: unknown, responds END.

IS: unknown, responds with letters ABCDE, bank numbers of some sort?
IS b: stores b into IS function. Multiple letters allowed but none higher
than letter 'F'.

LL: read lower limit (for searching between frequencies).
LLfffffffff: set lower limit.

LU: read upper limit.
LUfffffffff: set upper limit.

LO: L/O (channel lockout) status
LON: lockout channel
LOF: restore channel

MA: reads data from current channel. Similar to above. Does not work while
trunk tracking.

MAccc; ccc=channel number (e.g. 001): Puts radio to channel ccc and responds
with data (e.g. C001 F04535000 TF DF LF AF RF N00). Will halt scanning.
```

Note: F=off, N=on
TF=freq. was entered as trunked (off)
DF: DELAY status (off)
LF: L/O status (off)
AF=?
RF= LINE status (off)
N00=reflects CS number (CTCSS)

MD: unknown command that returns a two digit number.
01 is returned after a write to a memory channel
17 after a write through the RFnnnnnnnn command
07 when in trunk tracking mode.

MUF: opens squelch
MUA: closes squelch
MUN: appears to turn on an auto-squelch ? Can't unsquelch radio manually
in this mode.

PMccc: read contents of memory channel ccc. Does not halt scanning. Similar
to MAccc function
PMccc ffffffff; ccc=channel, ffffffff=freq.; Programs channel ccc with freq.
Note there is a space (ASCII 32/20 hex/SPACEBAR) between the last c and the
first f.

PR: status of PRIORITY scan function.
PRF: sets function off
PRN: sets function on

QU: Status of QU (activity indicator ?)
QUN: Unknown function, causes data port to output + if receiving a signal
and - if not.
QUF: turns off QU

RI: responds with status of unknown function - N for on, F for off
RIN: turns unknown function on
RIF: turns unknown function off

RF: responds with freq. in format ffffffff only if this frequency is set by the
RFnnnnnnnn command. If the frequency is already in memory assigned to a channel
then the scanner responds NG. Does not work while trunk tracking.

RFnnnnnnnn; nnnnnnnn=freq. (e.g. 470.5875 MHz -> 04705875): Dials up the freq.
in the radio (like the VFO mode) but does not program it into channel memory.
Scanner replies OK after command.

RM: Reads mode (e.g. NFM, AM, etc.)

SB: responds with bank letter(s)
SB b: goes to/turns on bank b. Multiple letters can be used. Works while
scanning. Does not work while trunk tracking.

SG: S-meter reading and frequency (e.g. S014 F04535000). No signal responds
S014 for me while a strong NOAA weather station returns S026.

SQ: responds - when squelch is closed and + when open or receiving signal.

SS: responds with END. Meaning unknown.

ST: returns 0000000 - meaning unknown. Produces error while trunk tracking.

WI: returns Wnnn Ffffffff; nnn=three digit number of unknown significance and Ffffffff where the lower case f is the frequency. Works in MANUAL or SCAN mode (example output: W084 F01541075).

==========

KEY functions. Just type KEYxx and carriage return; xx=number below. Acts the same as pressing front panel buttons.

Note: Some of the KEY functions producing errors are likely because the command is issued out of context. They probably are valid functions.

KEY00: functions SCAN button
KEY01: functions MANUAL button
KEY03: unknown
KEY04: HOLD function
KEY05: Toggles PRIORITY (same as PR)
KEY06: Toggles L/O (same as LO)
KEY07: steps up through channels (will not put radio into manual from scan)
KEY08: steps down through channels
KEY09: SRC button
KEY10: Turns on WX
KEY11: Toggles DATA skip function
KEY12: Toggles DELAY (same as DL)
KEY13: Toggles TRUNK button, not the function.
KEY14: Functions display dimmer
KEY15: Functions STEP button
KEY16: Toggles LINE function
KEY17: disconnect radio from computer (activated ALRT/RMT button)
KEY18: bank letters began flashing. Probably SEND button.
KEY19: unknown, displays flashing error.
KEY20: Toggles CTCSS (same as CT)
KEY22: Toggles FREQ/CHAN
KEY23: Toggles LOCK

KEY02 & KEY21: appear to be unused.

==========

I have been successful in programming the radio by creating a text file and sending it to the scanner. I had to introduce a small delay between characters so the data wouldn't overflow the scanner. Each channel and frequency is on a separate line followed by a carriage return and line feed.

For example:

PM001 04537250
PM002 04535000
PM003 00459400
etc...

==========

If anybody finds more commands or any other pertinent information let me know.

I'll update this list as I find out more. For the time being, I'm using a Windows based terminal program to control the scanner. In the near future, I'll be writing my own application with Visual Basic.

Will,
Go out to the Maxim site and have a look see. They might have something on a chip that will take care of it for you. Don't have the page address at hand but the full name is Maxim integrated Products Inc. They make a variety of IC level converters that require a minimum of external components.

Sorry to jump in with a possible silly question but these "service manuals" you are refering to, are they actual service manual or are they the owner's manuals? I've been following the thread and what made me wonder was that I have a PRO-2021 and was able to get the owners manual for it without problem. I did notice that it is not listed on the list of manuals that are not being released. I am just a little confused and was hoping for a little clarification.

Thanks
Steve-O

I don't know about you, but I ain't never owned no scanner with an SO238
spigot on the back of it! And besides, those el cheapo Silver-plated
teflon connectors you see at the ham shows are crap anyway. The
impedance of them is decidely something other than 50 Ohms! Same goes
for the cheapo MNO mounts I've seen.

> RG-8 is never a good choice for the apprentice, neophyte, and
> entry level types. And it's not particularly a good choice for
> the journeyman. And, of course, the expert wouldn't touch the
> stuff with a stick.

I have to go on the assumption that if you are using a better coax than
RG8 then you must be some kind of DXer. It's really not that bad! Most
scanner types I talk to go for the local traffic only anyway. If you
live waaaaaayy out in the sticks it may be prudent to use a lower loss
coaxial cable. But, in a case like this it would probably make sense to
use a preamplifier anyway.

> Ha ha ha ha ha ha. Noise Figure isn't the only spec, fella. Try

Just like a high-gain antenna with low-loss feedline in the big city!

> But I still want to know WHAT preamp has good noise and compression
> figures for 25 MHz - 1300 MHz.

I can't remember the last time I tuned in something lower than about
400MHz.
All the action 'round these here parts is between 800-900MHz.

> More than likely what you heard was increased intermod, images, and
> pseudosignals. On the other hand, if you are in an RF-quiet zone,
> then a poorer dynamic range is not going to immediately show itself.

> And you may be misled into believing some weird things........

I'm using an 18dB wide-band pre-amp on my repeater receiver with only three notch filters in front of it and no isolator on the TX. It's up about 400ft in a big city with a 11.5dBd antenna on it. I don't get the shit sacked out of my front end. I don't think I've ever seen a RX multicoupled system that didn't have great gobs of gain on it. These are wideband amplifiers too usually in close proximity to transmitting antennas.

> I don't assume much, either. When a novice asks a question, it's
> pretty easy to tell what level of advice he needs. The worst thing
> you can do is give "expert advice" to a novice. THAT will make
> him incompetent righteously quick....and then, incontinent.....
> before you get done with him.

I disagree. If you properly explain a scenario to someone - such that they actually understand it, they can more appreciate the pros and cons of their actions. For instance if the original poster were interested in receiving a single "DX" channel and installed a pre-amplifier to do this he might give up if the scanner was being overloaded severely. If however, he was aware that a band-pass filter could be added between the antenna and the pre-amplifier to recover the DX signal clearly he would invariably go that route.

> It's of cardinal importance that the entry level hobbyist
> spend his money wisely and make few or no mistakes at the onset.

Bill, you are very good at hand waving. "PL-259 plugs at UHF
frequencies where they are lossy as heck." You chide me for not
doing my research and recommending a particular preamplifier, yet
you do not do yours and back up your hand waving with facts --
in this case loss figures in dB for PL-259 connectors at a range
of frequencies.

> RG-8 is never a good choice for the apprentice, neophyte, and

More blanket statements that are unsupported except through hand-
waving.

> You wouldn't use a preamp in a scanner installation in the first place.
> A smart scannist wouldn't, anyway. Like.....WHAT preamp would YOU
> use or recommend for 25 MHz - 1.3 GHz coverage, pray tell?
>
How one that has been in the industry for as long as you can be
so ignorant amazes me. Let's look at the preamp I'm using. It's
based on the mini-circuits MAR-6 module. Here are the specs for
the MAR-6:

Frequency Range: 0-2000 MHz
Gain: 11-20 dB
1dB compression point: +2 dBm
Noise Figure: 3.0 dB
3rd Order Intercept: +14.5 dbm
Price: $1.66

Building a preamp out of the MAR-6 is quite simple for anyone
with basic electronics skills. In fact, there is an article
in the November issue of QST on doing just this for anyone that's
interested. However, if you aren't keen on building one yourself,
Mini Circuits offers preassembled units. The MAN series are small
sealed modules that need only a power source and coax to be attached
to them. But if you don't want to have to touch a soldering iron
at all, you can look at the ZFL series. For instance, the ZFL-1000LN.
Specs are: Gain: 20dB +/- 0.5 dB from 0.1-1000MHz. Noise Figure
is 2.9 dB. Third Order Intercept point is +14 dBm. Moreover,
you can order this module which costs $89.95 with N connectors on
it so you don't have to use those "lossy as heck" PL-259 connectors.

BTW, I have no affiliation with Mini Circuits other than as a
satisfied customer. A number of other companies make similar
products and anyone considering a preamp should look into them
and select one that best suits their needs.

> "dinner".
>
I've already stated exactly what I'm using.

Please note that I am advocating using preamplifiers primarilly
when they are mounted at the antenna and when there aren't any
strong RF sources in the area. Under these limited circumstances,

they will produce superior results to an identical system without the preamplifier present (assuming the preamplifier has equal or better specs than the receiver -- not hard). Adding a preamplifier at the back of your scanner may also help if you are in an area without any strong RF sources, but not nearly as well as installing it at the antenna.

I'm now going to get a bit technical on you to illustrate my point. A receiver's noise figure is what determines it's sensitivity. This is the figure that establishes the noise floor when no antenna is connected to the receiver. It is computed according to the formula:

```
(F2-1) (F3-1)
Ft = F1 + ------ + ------ + ... [1]
G1 G2
```

Where F is the overal noise factor for the receiver, Fn is the noise factor for the nth stage, Gn is the gain (multiplier) of the system through the nth stage. Noise figure is related to noise factor by the formula:

```
NF = 10 * log(F) [2]
```

Let's assume for the sake of argument that the preamplifier and the RF amplifier in the radio have a noise figure of 3 dB (a typical value). Further, let's assume that we are using 75 feet of RG-6 coax for the transmission line and we're interested in listening to frequencies in the 800-900MHz band. The loss for RG-6 cable at this frequency range is about 5.9 dB per 100 feet or 4.4 dB for 75 feet of cable.

Since the antenna and transmission line are effectively the first stage of the receiver, they determine the F1 and G1 terms in the formula [1] above. The noise figure of the antenna and transmission line are proportional to the temperature in Kelvin, but for the sake of simplicity we will assume they are 0 dB (F1 = 1).

Given F1=1, we next compute F2 and G1. F2 is 3dB => 10^.3 = 2. Since G1 is a loss, it is -4.4 dB => 10^(-.44) = .363. Plugging these values into the first two terms of formula [1] above we get:

```
(2-1)
Ft = 1 + ----- + ...
.363
```

Since the remaining terms rapidly decay in their contribution of the overall noise figure, it is reasonable to ignore them and look at what the influence of a lossy transmission line has done to our overall noise figure.

Ft works out to be 2.75 not including the contributions from the remaining terms (which are the same regardless of whether or not

a preamp is used anyway). Converting Ft into a noise figure we get 10*log(2.75) = 4.4 dB. Notice that the presence of the lossy transmission line has increased the system noise figure by approximately 1.4 dB. This results in a significant loss in sensitivity because of the transmission line.

Now, let's assume we put a preamplifier in between the antenna and the tranmission line with a gain of say 10 dB:

(1-1) (2-1)
Ft = 2 + ----- + ----- = 2.275
10.0 3.63

NF = 10 * log(2.275) = 3.6 dB

We have improved our noise figure and thus our sensitivity by 0.8 dB by using a preamplifier in this case. In actuality, our results would be even better because the resistive elements in the tranmission line would contribute more noise to the non-preamplified system than to the preamplified system.

All of the formula I have used in the above calculations can be looked up and verified in the 1998 ARRL Handbook.

Two conclusions can be drawn from the above illustration. First, if the transmission line offers a significant loss to the system, it can seriously affect the overal noise figure of the system and significantly degrade the receiver's sensitivity. Second, the addition of a preamplifier reduces the negative impact of a lossy transmission line. Moreover, if the preamplifier has a lower noise figure than the RF amplifier in the receiver, it can further lower the system noise figure and improve sensitivity.

> Ha ha ha ha ha ha. Noise Figure isn't the only spec, fella. Try
> dynamic range, 1-dB compression points; etc. For all those scanners

>
I see you can read a spec sheet, but do you really know what the specs you mention mean. I have stated, and I'll state again that the system noise figure is the primary determiner of the receiver's sensitivity.

Your statement that all scanners with noisy front ends have poor dynamic range is without foundation. In general, there is an inverse relationship between noise figure and selectivity in a given circuit. Dynamic range is a measure of the "goodness" of the compromise between a lower noise figure and high selectivity (as determined by the third order intercept point, 1dB compression, and bandwidth).

> But I still want to know WHAT preamp has good noise and compression
> figures for 25 MHz - 1300 MHz.
>
I guess that depends on what you consider "good." Good receivers
try to strike the best compromise between low noise figure and
good compression/third order intercept numbers. Lossy transmission
lines significantly degrate the system noise figure. Preamps
improve the noise figure at the expense of increased susceptibility
to overload. Depending on where you live, they may really enhance
your reception or make it worse. These are the facts.

> > My experience confirms what I say above: I live in an area without

> And you may be misled into believing some weird things........
>
Ha ha yourself. You don't even know what dynamic range is and
here you are trying to tell me I can't tell a real signal apart
from intermod, images, etc.

For the record, dynamic range is a measure of the goodness of the
compromise between low noise figure and good compression/third
order intercept numbers. Two measures are often used to measure
this. The first is called the "spurious free dynamic range" and
is typically measured with a two tone test. The second is called
the "compression free dynamic range" and relates the 1dB
compression level with the noise level. In both cases, either
lowering the noise floor (lower noise figure) or raising either
the 1dB compression point or the 3rd order intercept point will
result in higher (better) numbers.

> > A bypass is not necessary with a broadband preamp (unless you're

> then a gain control? But no, you said nothing of the sort. So
> yo've got to be kidding?
>
I keep repeating myself. If you live somewhere without any strong
RF sources nearby, you can afford to give up some 1dB compression
and third order intercept in exchange for a lower noise floor. Now,

if you have a preamplifier with a gain control, you might be able
to make use of it in areas with strong signals nearby. If you're
tuning in a band with a strong signal nearby, turn down the gain.
If you're tuning in a band without any strong signals, turn it up.

Hi Stephen,
The HS200 is a very nice radio. Check out my HS200 page
which has a review of this radio as well

http://www.qsl.net/n2mca/HS200.HTM

> Also new to the pl board, can someone explain how it works in programing
> a frequency with a pl, and also one that has no pl.

It's pretty easy actually. It's just another piece of data
that gets tagged along with the other memory channel data.
If you attach a specific CTCSS/DCS tone/code to a channel
and put the radio in tone mode, the radio will not let active
signals come through unless it "sees" a matching CTCSS/DCS
tone/code being broadcast with the audio.
For more info check out my New Scanner User FAQ

http://www.qsl.net/n2mca/NEW_USER.HTM

Let me know if I can help answer any other questions!

Brampton fire is exclusively on the trunking system now. So is Caledon
fire. The old 154.800 fire freq is no longer in use. And as of sometime
in the past few days, Mississauge (Peel Regional) police are No Longer
simulcasting on the vhf frequencies. I need a trunktracker for
x-mass....

Anybody done any business with Martin Lynch in England? If so, what has
been your experience? I'm considering buying another radio through them,
but have never dealt with before or known anybody who has. I know its
been over a week since I requested some info via email and they have not
responded yet, so they're not off to a good start. But that is not
always indicative, so I'd like some other opinions.
Since they haven't answered any of my questions, I'll turn to some other
sources. Your feedback greatly appreciated....
Thx -K2

1. If an order is placed for shipment to the United States, is VAT
collected on that sale?
2. The ICOM R-10 that you sell, is that full frequency or cellular
blocked?
4. What is the approximate shipping cost for UPS to the United States?

Source record: 178639

I have a BC760 with a weird problem. I bought the scanner about 18 months ago, and I entered the 800MHZ Sacramento County Sheriff freqs with no problem.
A couple of weeks ago, I tried to enter the Sacramento City freqs (866-867Mhz) and it gives me an 'error' message. I tried the Uniden Customer Service(?) line and they said to send it in. I have tried the hold 2+9+manual reset, but it still won't let me enter ANY 800MHZ freqs. (Yes, it has had the mod done.) Any help out there??

Well, to start with, at this point there are no rechargeable batteries that match the battery life of a single-use alkaline battery. The only rechargeable that comes close is the Renewal "rechargeable alkaline" battery. So, if you're picking a bateery for use in an application that has a high current drain over long periods, alkalies are usually the way to go. That is unless you feel the money saved in using rechargeables outweighs the inconvenience of having to frequently recharge your batteries.

Now, for the differences among rechargeable batteries.
Obviously, you're familiar with Nicads. They have a good turnover in that of all the rechargeables out there, they can be charged, discharged, and recharged the longest number of times before they wear out. The drawback is that they have a short run time (they lose their charge faster), and they may suffer from the "memory effect," where charging the batteries without completely discharging them may reduce the amount of charge the batteries can hold in the future. Some argue that the memory effect no longer exists in the NiCds that are manufactured today, but that's generally up for debate (and an argument I'd rather not go into here).

Also, there's the Nickel Metal Hydride battery (NiMh). These batteries generally hold a greater charge (and last longer between charges) than NiCds do. They also allegedly suffer less from the memory effect. However, NiMh batteries cannotgo through as many charge/discharge cycles as a NiCd can, and so, they may not last as long in the long run.

Finally, you have the rechargeable alkaline battery (the "Renewals.") These batteries are better suited for high current drain applications, and they last somewhat longer than the other rechargeables, but supposedly, they can only be recharged several times before wearing out (usually not more than 10 or so).

Hope this helps...

hope this helps...

From: NewsRadio <jmckay@interlog.com>
Message-ID: <348469A7.9714410C@interlog.com>
Source record: 178644

Are there any universal low power VHF frequencies similar to the GMRS UHF frequencies avalable for use country wide in the states? Our company has VHF hand helds for use in construction work in Canada on 151.055 151.115 and 151.580 which are Lower Power Industrial (LPI/LPU) frequencies in Canada and I'm wondering if we could get licenced for these freq's in the US for work we are doing there (IE the crews working in the US could simply take their radios down there with them). Or should we get UHF GMRS hand helds while working in the US. Your thoughts would be appreciated...

Try this :)

FT50R - Software Modifications
Ingra-Beton@t-online.de, Date: 31.03.97
==========
This is modification of the first version, with same fix up's, typing
error corrections and better explanations (one Example too).

The Problem:

I have purchased a FT50R a couple of days ago and tried to make the
MOD's
as described by Bill Childers (KE6VVW).

The removal of the solder jumper Nr.1 worked just fine and the
MARS/CAP was there. But as I tried to make the Trick to pull the
adapter cable out of the radio, ..., that don't work.

RT Systems says:
> The firmware inside the radio has been changed so that pulling the plug
> will not toggle the radio into a European mode. This change was made in
> radios with the 3rd and 4th digits of the serial number greater the 05.
> --
> Rod, RT Systems Amateur Radio Supply, Huntsville AL.
> Sales 1-800-723-6922, Tech 1-205-880-3093

So I had to find something else, here it is.

This is a method to do any MOD to your FT50R. The procedure is very
simple
and fast done:

1. You make a template from your FT50R
2. Change 3 Bytes in the template
3. Upload the template to your FT50R

So you can switch to any BAND, you don't have do hardware interventions
or similar staff like pull the adapter cable out, ...

If you want do return the FT50R to its original state, just upload the
old (unmodified) .TPL to the Unit.

Information and explanations:

All MOD's can be made by software only. To do the MOD's you need the
ADMS 1C Software (I am using the 1.05 Version) and a HEX editor to
manipulate the .TPL file (I am working with .TPL file's only)
I am using HIEW 5.24 (Hacker's View) but any HEX editor will do the
job (PCT, Norton, Multiedit, ...)

Everyone has noticed the problem after making same MOD's to the Unit
that the old .TPL files can not be uploaded to the Unit any more.
There is a simple protection scheme (2 bytes) that prevents uploading
a .TPL file from a different hardware configuration to the Unit.

This is a description how to bypass this protection. By uploading a
.TPL file with different hardware configuration, (from a other Unit
or just to change the 2 bytes) the Unit will be assigned to this new
configuration.

First a description of Terms and Positions:

1. Current_Byte
.....
This is the Byte that tells the current Status (Hardware configuration)
of
the Rig, you can get this Byte as follows:
- Make a .TPL file from the Rig.(Menu: <Radio> <Create template>)
- Edit the .TPL File with e HEX Editor.
v this is the first byte*
- On the File Address 05E2 is the sequence 07 XX
^ Current_Byte
(Addr.:05E3)
- The Current_byte can be in the Range from 00 to 06.
- *the first byte is usually 07, by experimenting with nonstandard
Numbers
you can change this byte also. (03 or same other value, but very
rare)

2. Key_Byte (Security Key)
.....
The Key_Byte is at the same place as the Current_Byte, but in the .TPL
file you intend to upload.
If you want to upload a .TPL File to the Rig, the Key_Byte must match
the
Current_Byte (that means that the Hardware configuration of the Unit and

the .TPL file you intend to upload must be the same). Just change with
the
HEX Editor the Key_Byte of the .TPL file you intend to upload to be the
Current_Byte and you can upload anything (any .TPL file) to the Rig.
!!! No more CERR Messages !!!
(As mentioned in 1. if you change the first byte, you have to change
this)
(byte also (in the .TPL File you intend to upload) to be the same Byte
as)
(in the Template you have just made to read the Current_Byte.
)

3. Band-Set_Byte
.....
- Edit the .TPL file you intend to upload with e HEX Editor
v* v Sub_Band-Set_Byte
(Addr.:0CE8)
- On Address 0CE6 is the Sequence 07 XX XX
^ Band-Set_Byte (Addr.:0CE7)
This Byte tells the Rig to switch to Band XX (XX is a Nr.between 00 and
06)
To change the Band simply change the Band-Set_Byte to the desired
Number.
After Uploading the Modified .TPL File to the Rig, it switches to the
desired Band and the Current_Byte becomes the Band-Set_Byte. That means
if
you want to upload later something else to the Rig, you have to change
in
the .TPL File you intend to upload the Key_Byte to the new Current_Byte
(with the HEX Editor).
The Sub_Band-Set_Byte tells the Rig in with Sub Band to switch (see
Table)
*The byte (0CE6) is usually 07, rare 03 or same other number.

Example
.....
Now, to do a band change do as follows:
- let's assume you have BAND_A1 (USA) and want to switch to BAND_F3
- make a .TPL file from your unit (let's assume original.tpl)
- copy the original.tpl to mod1.tpl (this file we are going to upload)
- read the Current_Byte from original.tpl (as described in 1)
(for the BAND_A1 we assumed you have it will be 01))
- set the Key_Byte in mod1.tpl to be the Current_Byte (01) (as described
in 2). It is logical that the Key_Byte will already be 01, you've just
made the copy, but it is a matter of principle, keep reading.
- set the Band-Set_Byte in the mod1.tpl to 00 (for the BAND_F)
- set the Sub_Band-Set_Byte in the mod1.tpl to 03 (for the Sub BAND F3)
- upload the mod1.tpl to the unit.
- power off, power on, now you have BAND_F3, DONE.

- let's assume you want to switch now to BAND_B2a
- make a .TPL file from you unit (let's assume temp.tpl)
- read the Current_Byte from temp.tpl, it will be 00. (BAND_F)
- copy the original.tpl to mod2.tpl
- set the Key_Byte in the mod2.tpl to be the Current_Byte (00)
- set the Band-Set_Byte in the mod2.tpl to 02 (BAND_B)
- set the Sub_Band-Set_Byte in the mod2.tpl to 01 (Sub BAND B2a)
- upload the mod2.tpl to the unit.?
- power off, power on, now you have BAND_B2a, DONE.

and so on ...

Here are the MOD's (Band's) available:

I 00 01 02 03 I <- Sub_Band-Set_Byte (Address 0CE8)
---
00 I F1 F2a F2b F3 I
01 I A1 A2a A2b A3 I
02 I B1 B2a B2b B3 I
03 I C1 C2a C2b C3 I
04 I D1 D2a D2b D3 I
05 I H1 H2a H2b H3 I
06 I FrEE FrEE FrEE FrEE I
---
^ Band-Set_Byte (Address 0CE7)

When you set the Rig in a band (with the Band-Set_Byte) then you can
switch
from Sub Band X1 to X3 (if solder jumper 1 removed) with the key
sequence:
- Hold Lamp and Knob by powering_on to switch to X3 Subband
- Hold Lamp and Knob by powering_on (you will see ALRST prS5) and then
press the function key to switch to X1 Subband

The TX for the X3 Bands is:

BAND SUB_Band TX
F 3 120-222 320-500
A 3 140-174 420-470
B 3 140-174 420-470
C 3 140-174 420-470
D 3 144-146 432-438
H 3 144-148 430-450
FrEE 50-300 300-540*

*It will TX from aprox. 118-233 and 312-508
RX from aprox.71-540 and 600-999 depending from the Unit.

The Sub Bands 1,2a and 2b are with restriction variations in TX and RX
and
I am to tiered to examine them closely and write them down. I guess that
they are not very interesting.

ARS lost - effect

The FT50R has e BAND_PLAN like database and depending for witch country
your unit is configured (A,B,C,D & H) it is using the repeater database?
from his Memory for that country.

It is understandable that for the BAND_FrEE and BAND_F
(TX:120-221&320-499)
there is no data in the database because those band's are not for any
specific country. That is why the ARS does not work any more, and not?
same mess up (magic) in the memory of the unit.

That does not mean that it is not possible to enter additional data to
the ARS memory database (I am working on it).

If you want to use the ARS again you just have to switch it into any
ordinary country BAND_X and it will work again.

Original .TPL file

If you don't have a original .TPL file, you can make (improvise) one:
1. Start the ADMS 1C software
2. Goto the File Menu and save a .RDF file as original.rdf
(don't download anything from the Unit, don't use a template)
3. Change with a HEX editor the first 3 bytes from RDF to TPL
4. Set the Key_Byte in this file to be the Current_Byte of your Unit
5. Rename the original.rdf to original.tpl
6. Start the ADMS 1C and upload the original.tpl to the Unit.

This will switch your unit to BAND A1 (USA), ARS will work again !

Disclaimer:

Don't TX and RX at frequencies that you are not allowed to!
I do not guarantee the validity of this information,
as Yaesu may change programming or hardware so that some of the
techniques in this document may cease to function. I am not
responsible if these instructions damage your rig in some way. All
I can say is that I have performed the following procedures to my
unit, and I am quite pleased with the results. Your mileage may
vary, etc.

A mile or two for range doesn't need a repeater. You can get better
from a CB under most conditions.

Jeff Zeman found the Relm HS200 supports a "hidden" 6.25 kHz step size
in the UHF band.

Sorry, I don't recall the details clearly. I think you have to
use the keypad to enter a frequency on the proper
split (e.g., 460.00625) then use the tuning knob.

gee...what a question?

find out the going price for this unit? 300 plus dollars

gee...what next?

take 300....subtract 100...you see, you don't have to
pay 200 more.

You make up your mind as if it's a good deal.

HINT: if you don't agree to its "integrity" you can
always sell it for 200 bucks...and get your money back.

Plus another 100 bucks to do this all over again...

Ain't this NG fun?

bill

143. pro-64 or SC-150 Which one ?????

Newsgroup: rec.radio.scanner

Hi all, I am currently playing with a radio shack Pro-64 and a Uniden SC-150 to see which one is better. Being the the radio shack was on sale for $199, I had to try it, the Uniden was $175. I'm new to scanners so I don't know what all to specifically look for. My main use for this scanner would be for listening to railroad channels but police activity is also interesting and depresing.

The Radio shack has many more features but scans slower, 25 channels/second according to the spec. The Radio shack has a bit less of that squelch noise at the end of transmissions but it kind of seems like the Uniden picks up at least 1 or 2 channels the radio shack doesn't (maybe a birdie freq. thing??)

The Uniden is 100 channels, the Radio shack is 400 channels. The back light is better on the Uniden but the Radio shack is more versatile with its power options. The Radio shack has that upload feature which is nice, probably because it only has a 1 hour memory retention when power is removed, the Uniden is at least 3 days.

It seems like both are good scanners and either one would be a good choice but I was hoping someone had experience with either one to share with me.

Thanks a bunch in advance, looking forward to a response so that I can return one of them soon....

Dieter,
Take back the SportCat and stick with the PRO-64. More
channels, more features, better battery options and better
interference rejection.
While the 64 is not the most sensitive raiod, you can
help it out a bit by buying a better antenna for it. Try
the telescoping whip at Radio Shack part # 20-006. It runs
about $10 and is a very good investment.
Good luck with your new radio!

Strong signals,

Ok, FOOL. Here is my original post from 11/12. I will admit I was wrong. I got it backwards. But had you not bitched and whined, you may have gotten away with your single little attempt at relevance. However, your big mouth prompted me to check things out. I asked you to provide THREE examples over the last TWO months. Even more impossible for you to do.

So, your first post was null and void as it was over two months old. I'm still waiting on 3 posts from you, moron. Good luck. You'll need it.

So, usa.net is a real e-mail? That's an anonymous server. Anyone can get an address there. If I go get one and post it for you, will you feel better? If it will, I'll gladly go get one for you.

Why don't take my challenge I posted here? Is it because you can't? I want you to show me and everyone else here 3 posts by you over the last 2 months where you have provided anything at all to do with scanning. I've already looked. There are ZERO. Stop avoiding it.

I don't claim to be the scanner guru here like you do. But you definately are the lowest source of information in this group by far.

Keep on blowin, wind bag.

Time to keep up to date with new technolgies Robert. FRS is the latest way
for familiesto keep in touch with each other. Yes the airtime is free,
distance is limited (not more than
1/2 -1 mile in ideal conditions). Great for malls, sports, camping,
hunting, etc.

FamilyRadio Service (FRS) Walkie Talkies are point to point and require
no license. Sold
everywhere (RS, Circuit City, etc.). Works in the splinter channels between
the GMRS frequencies
(~462 Mhz).

Uniden BC200xlt FOR SALE
Classic programable scanner.
Channels: 200
Range: 29-956Mhz THIS SCANNER IS CELLULAR CAPABLE
Features: one touch weather recieve
Programmable search limits
Lighted display
10 memory banks 20 channels each
Keypad lock
Priority channels and toggle feature
Channel lockout feature
Scanner comes with flexible antenna and is in good condition.
This scanner has not yet been modified but can be modified to: extend
battery life, speed scanning rate, keep screen lamp lit, restore cellular
frequncies, and a few more. This is a very durable versitile scanner.
Needs new battery pack so asking price is:
NEGOTIABLE
$125.00 (postage paid by me if bought before Dec. 8th)
NEGOTIABLE
New batteries can either be purchased at Radio Shack and manually replaced
into the existing pack ofr around 17$# or purchased as a new pack (BP200)
from RaceScan at http://www.racescan.com/access2.htm for $29.

If you are thinking of getting batteries for your scanner or cd player
or other item that eats batteries then Nicads are the way to go . If
you compare a regular aa batery it delivers 1.5 volts for a period of
time and then drops down in voltage slowly From items like camera
flashs the more expencive alcoline last longer and deliver power
faster to the charger.

But I like Nicads a Nicad aa bat is 1.2 volts and works by delivering
a continuos power of 1.2 volts and then stops. the great thing is than
you can recharge them up to a 1000 times (they say)

When you use NIcads fully charge them and use them until they die.
If you use them say for 5 minutes and recharge them and use them for 5
minutes and recharge them they will develop a memory in them and only
work for 5 minutes.

STORMTRACKER:
Don't you dare! They have inferior quality
antennas for BIG $$. I usually get people that can't find what they
want at that BIG "McDonalds electronics" store! E mail me & I'll send
you info on what you want, that will LOOK GREAT & work great too! OR
you can look up a CB shop in your area to see what they have. I am
Dave@ truth@planetc.com or http://infinet.org:3/dudes.htm then click
"Shortwave," then click CB for the NOS CB list (no antennas on this
list, I think. You will have to E mail me for details! Dave

Not surprising at all, given the time of year.
With Christmas shopping in full swing, the shipping companies are being stretched thin again, and slower service will be the norm, especially since, with wages up, and unemployment down, extra help that's decent is hard to get. We'll notice it in the stores with store personell, too.

: Time to keep up to date with new technolgies Robert. FRS is the latest way
: for familiesto keep in touch with each other. Yes the airtime is free,
: distance is limited (not more than 1/2 -1 mile in ideal conditions).

However, the term "airtime" denotes that you are using a repeater (i.e.
cellular or SMR). This is irrelevant when two people are communicating
simplex between two units.

[...]

Greetings Barry,
Robert, as well as anyone else who's been here for a few days is well aware of what FRS is and the technology behind it. Whoops, sorry. I just remembered that this was crossposted to a lot of non-FRS newsgroups.

Anyway, the concern he expressed is that exclaiming "Free airtime" for FRS misrepresents what FRS is and does (and can't do). One might just as easily say that CB or Amateur Radio offer "free airtime." While true on the face of it, it may leave some expecting more from these radios than they'll ever get. (i.e. "How do I dial grandma on my FRS radio?") IMHO, "free airtime" is simply not applicable to FRS in and of itself. Like writing a bicycle ad exclaiming "No bus or cab fares!!"

And thus we see one of the bigger problems with posting hyped-up ads to Usenet newsgroups -- They get nitpicked to death. ;-)

73's all 'round,
Charlie - N3HAZ

181. Have all Police and Fire Gone to 800 MHZ?

Newsgroup: rec.radio.scanner
Date: 1997-12-02 00:00:00 UTC
From: lester <lester@intop.net>
Message-ID: <34835932.0@christy.intop.net>
Source record: 178844

Over the past couple of years I have picked up less and less on my scanner, a Pro-35 from Radio Shack. Used to be all the police, etc. in my area were using frequencies that I could pick up. Now, hardly any at all, even the ambulance services and volunteer fire departments. I have frequency ranges 137-174 mhz and 406-512 mhz. I suppose I now have to get an 800 mhz scanner, but the slide off rechargeable battery pack on my Pro-35 is one of the main things I like about it, and Radio Shack does not have one like it in 800 mhz.
Any ideas?

Source record: 178846

This is a Realistic PRO-30 portable scanner. In very good condition. I am the original owner and the unit comes with the manual, power supply (or can be used portable) and a rubber duck type antenna that has a quick release mount. This unit is a 16 channel programmable
receiver.The frequency coverage is 30-50Mhz Vhf Lo. 50-54Mhz. 108-136Mhz. 138-144Mhz. 144-148Mhz. 148-174Mhz. 380-450Mhz. 450-470Mhz. 470-512Mhz.
This scanner receives police frequencies car to car, car to helicoptor etc etc, Ham frequencies, Aircraft
frequencies, and Government freqs. It will even receive cordless phones. This scanner also has a search feature that will search between any two frequencys. A large multi purpose liquid crystal display that shows which channels and frequencies are being scanned, monitored or programmed as well as the status of the channels. It comes with a power supply so you can plug it in the wall with no need for batteries or you can run portable with 6 AA batteries . Has new backup batteries installed. You can also run rechargeable batteries if wanted. I will trade this unit STRAIGHT ACROSS for a yacht boy 400 thats in good condition. I live in the Los Angeles area and if your close I will drive to you. Dan... dragnet2@aol.com

184. [Q] Icom repair policy

You will get it back in the condition you sent it in.

None of us has time to play games with customer's radios. We ae busy enough trying to stay on top of things.

No one has any responsibility or liability to the pheds to block a customer-owned receiver. The statutes apply to new receivers being imported and/or Type Accepted only. The whole issue is one which we comply with only under protest. It is expensive and annoying.

Plus, doing any more work than is necessary only opens the door to problems put into the radio by the service techs.

There was a fairly recent engineering change to replace two FETs with better spec units in the R7100 which may well be your problem. You should get these at no charge since it is not your fault or normal wear and tear. The replacement is a fairly involved job and requires opening a deeply buried sealed module, SMD work, then realigning the radio. We stock the FETs and have done several dozen upgrades to R7100s. Usually the problem manifests itself with heat, especially in rack mounted units, but not always.

We would be glad to fix it for you and return the radio with the frequency coverage it had when we received it. Send it UPS with a note of the problem, your UPS return address and a phone number. If it is the FET problem all it will cost you is freight to us. If not we will repair it properly and timely for a fair price.

Regards ..... Steve (ICOM sales and service facility for commercial two way and receivers ONLY)

155.295 is where Northstar communicates with its base. In case a person
does not want to listen to all the traffic stops on the NJ State Police
trunked radio system!

For the uninitiated, Northstar and Southstar are the medevac choppers
in NJ. They are very active. NJ State Police troopers pilot the birds.

Both products are good, and, Mr. Cheek is not the only dealer in the US promoting WINRADIO. Rosetta has offered the scanning community the first product (actually not, but the only one that actually works) for scanning & receiving straight from a PC. That's technology and it deserves credit where credit is due - which is to the MFR and not so much the dealers. . .

> Radio Outlet).

Competence has nothing to do with the inferiority of PL-259 plugs
at UHF frequencies where they are lossy as heck. And low quality
PL-259's are worse than splices. You don't want to use PL-259's
in a quality installation where the work is above 50 MHz. Not if
you have any presence of mind and know beans from barns. Or, if
you MUST use them, then you use the type that are silver plated
with TFE dielectrics. But try getting those at a CB store where
the entry level hobbyist is likely to get his first guidance.

RG-8 is never a good choice for the apprentice, neophyte, and
entry level types. And it's not particularly a good choice for
the journeyman. And, of course, the expert wouldn't touch the
stuff with a stick.

You wouldn't use a preamp in a scanner installation in the first place.
A smart scannist wouldn't, anyway. Like.....WHAT preamp would YOU

use or recommend for 25 MHz - 1.3 GHz coverage, pray tell?

Frankly, I don't give a hang for your "findings". I answered a
generic question....one that was fraught with the potential for
misunderstanding and serious issues. What I answered was the
straight scoop and stood the least chance of being misunderstood
and misapplied. First, read the question.

So.....back it up with a recommendation of make and model of a
preamp that you think is better than not..... and get ready for
"dinner".

> First of all, a receiver's noise figure is almost completely

> has a lower noise figure than the receiver alone, the combination
> will now have a lower noise figure than without the preamp.

Ha ha ha ha ha ha. Noise Figure isn't the only spec, fella. Try
dynamic range, 1-dB compression points; etc. For all those scanners
with noisy front ends, they also have poor dynamic range where any
amplification of adjacent channels or even BANDS can cause the

front end to saturate and admit all sorts of junk.

But I still want to know WHAT preamp has good noise and compression
figures for 25 MHz - 1300 MHz.

> My experience confirms what I say above: I live in an area without

> 9913 coax with a longer length of the higher loss RG-6.

More than likely what you heard was increased intermod, images, and
pseudosignals. On the other hand, if you are in an RF-quiet zone,
then a poorer dynamic range is not going to immediately show itself.
And you may be misled into believing some weird things........

> > How the hell is the entry level and intermediate hobbyist going to "properly

> inline with the transmission line, plug them in, and you're done.

You have got to be kidding? Surely you jest? You're advocating
leaving a preamp on ALL THE TIME? For real? Well, if not a bypass,
then a gain control? But no, you said nothing of the sort. So
yo've got to be kidding?

> > Where do you find a "useful" preamp, good for 25-1300 MHz?

> any hobbyist grade scanner (including the Pro-2006).

No no no......that will hardly do. Don't make me or anyone else
do your research. Please specify makes and models of these
so-called "good" broadband preamps. And get prepared for "dinner".

By the by......write this down.....I was President/CEO for a time,
of the company that made "Anglelinear" preamps. Sorry to disillusion
you, but those preamps (first on the Web site you referred above)
were utterly great for narrow band apps. Not for wideband.) Even
what they have now specifies +/- 40 MHz of center freq. So where's
the 25 MHz - 1.3 GHz stuff? Scannists can't use narrow band
preamps to any great advantage.

You getting ready for "dinner", pal?

> > >> Stick that antenna up higher, and use a good grade of coax feedline.

I don't assume much, either. When a novice asks a question, it's
pretty easy to tell what level of advice he needs. The worst thing
you can do is give "expert advice" to a novice. THAT will make
him incompetent righteously quick....and then, incontinent.....
before you get done with him.

It's of cardinal importance that the entry level hobbyist
spend his money wisely and make few or no mistakes at the onset.
His chances of mistakes (and needless expense) are vast with
preamps and RG-8 coax.

I dunno.....maybe. On the other hand, RS doesn't make WIDEBAND preamps.
Whatever you have there dang sure doesn't cover 25 MHz - 1.3 GHz. The
narrower banded a preamp, the better it is overall in terms of gain,
spurious, dynamic range, etc. Gimmee the specs of that RS amp. I've
never seen a truly wide band amp from them.

Oh gawd.......lest we forget: Fight-O-Net! (May it rest in peace!)
Hey, that's where I fished up the Mongoloid Mongrel Monkey Mackey from
the sewers.

(Dang me. They oughta take a rope and hang me.....from the highest tree!)

That's exactly what Discipio and a *few* others are trying to do.
There is no legitimate bicker or comlaint. They're beating
a dead horse.

> Besides I came here for more imformation about Winradio
> and not to read 100's of post complaining about something .
> I still haven't been able to figure out what the complaints are about.
> Seems to be personal attacks,are the complaints due to Winradio be
> defective , is there some problem with it? Is it worth the price?

Well, I've owned one for a lot longer that I've been selling
them. I like it. I won't sell anything I don't like. The
only "problem" with it is it won't go mobile all that easily
since it takes an ISA slot in a PC.

The WiNRADiO has a great warranty and great tech support (if needed),
and it beats the snot out of its only (higher priced) competitor,
and effectively competes with radios that cost 25%-75% more.

Don't get the idea that you're getting a $2000 radio for under
$500 because you're not. But the value of the package is well
worth the money and more, IMHO. WiNRADiO opens new doors into
the world of monitoring.

It's worth your closer scrutiny and evaluation of the specs and
promo materials.

Just try your local Radio Shack. Last time I checked they had a
catalog from which you could order crystals for $5. The crystals are
mailed to you from somewhere in Texas, I believe. Prompt service

I have a frequency manager template available for anyone who is interested. It will only work in Excel 4.0 or higher.

With a cut,paste,save...the resultant file can be sent to your PRO-64/PRO-2041 with a terminal program, such as ProComm. This will program all 400 channels of your scanner in less than 50 seconds.

If anyone wants me to email them a copy, just sent me a note

Cathy

Hey, interesting group--I've been lurking for a few days. I have been interested in the scanning hobby for a long time, and have experience in the 11m (cb) and 2m (ham) radio range, tx/dx. Actually, I have yet to get my tech licence, so no transmitting on 2 meter, but anyway...

I went to Radio shack and plunked down some money for the PRO-64, since the $100 off sale was kinda hard to beat. I suppose I don't have any real questions yet, I just wondered if anybody knows of good informational sites to go to to find out about frequencies, etc?

Thanks,

JD

Message-ID: <01bcff1b$e6a4ef60$24947dc2@duffy-s>
Source record: 178651

Hi to all Icom control experts !

Could anybody help me with the following problem, I have been unsuccessful in attempting to read the Squelch condition of an R10 with the following CV-I command...

FE FE 34 E0 15 01 FD

The address's are ok, and frequency and mode control of the radio is ok, but I can't get any response from the radio with the above squelch command.

The command works fine with an R7100 and appears to be as stated in the R10 instruction manual. Also, the port is ok as data is output when CV-I Tranceive is selected.

Any help would be welcome.

Frank

all
> to specifically look for. My main use for this scanner would be for
listening
> to railroad channels but police activity is also interesting and
depresing.

I have a Radio Shack Pro-51 (a step below the Pro-64) and had a Sportcat
150. Both are good radios. I found the SC-150 to be easier to use (it was
my first scanner), and I would recommend it as a good scanner that will
give you lots of enjoyment without spending too long learning how to use
it.

>
> The Radio shack has many more features but scans slower, 25
channels/second

least
> 1 or 2 channels the radio shack doesn't (maybe a birdie freq. thing??)

Uniden radios typically have a long squelch tail. That is what you are
getting at the end of the transmission. My Radio Shack Pro-51 is just as
bad as the SC-150.

>
> The Uniden is 100 channels, the Radio shack is 400 channels. The back
light is
> better on the Uniden but the Radio shack is more versatile with its power

> options. The Radio shack has that upload feature which is nice, probably

> because it only has a 1 hour memory retention when power is removed, the
Uniden
> is at least 3 days.

What I liked about the SC-150 was that everything you needed was included.
With a Radio Shack radio, you have to pay extra for the batteries as well

as the power supply/charger. That is a major gripe I have with Radio Shack, even though I like my Pro-51. Having to buy ni-cads and a charger adds $20 to 30 to the price of the radio, and that's something you have to consider. (These are high profit items, and Radio Shack is expecting/hoping you will buy the accessories from them... try to get them elsewhere if you can.)

>
> It seems like both are good scanners and either one would be a good choice but
> I was hoping someone had experience with either one to share with me.

Although I sold my SC-150 about two years ago, I give it full credit for hooking me on radio monitoring. Because it was easy to learn, I didn't get frustrated and give up. Even though my current favorite radio is a 1000-channel Yupiteru 7100, I still miss my Sportcat, especially late at night when I hear a siren go by... It sure was a lot easier to turn on and start scanning instead of trying to remember what keys to press on my Yupi. Who knows. Maybe I'll get another Sportcat myself!

Back to your original question, both of the radios you mention are great radios, and you can't go wrong with either.

Happy Scanning,

Bill

>Im only 14 and i really want a 2006 please help me out! THANBKS A LOT!

Could you use a little less than 77 asterisks (*)? I'm also 14, and I got off my ass and got a Amateur Radio License (Ham Radio) and got the cash to buy my own scanner. Do you know how much a PRO-2006 costs? I don't think you do. It goes for around $300, maybe more. My first scanner cost me $5 at a flea market, so why don't you get off your ass and get some cash and buy one instead of begging us and cloging up the newsgroup?? I'm sure all you want to do is to listen to cordless phones and cellular phones. As a matter of fact, if you would have asked normally, I might have considered giving you my old BC-210 XW base scanner which I no longer use, but I you don't deserve that.

Sorry for anyone who had to read this, I just had to get that out!

I have the following equipment for sale..

(2) Uniden Pro 340XL $75.00 for both
40 channel portable handheld
40 channel LED display
High/Low power selection (4watts or 1 watt)
Push button channel selector
Low battery indicator light
Slide adjustments for volume & squelch
Units are in great shape & work well
Units are supplied with the following...
original boxes, owner/operator manuals,
rubber antennas that attach to units.
Batteries not included (requires 8 "AA" batteries for each unit)
Sorry, no cigarette power cords

Microphone Tester Station $27.00
Alan MT Plus Portable microphone tester
Test the following microphones...
RCI, Ranger, Cobra/President, Realistic, Midland,
and many other off brands.
4 pin, 5 pin, 5 pin din, 6 pin, 8 pin
Unit is in great shape & works well
Supplied with 9 volt battery

SWR/Power Meter/Matcher $12.00
Para Dynamics PDC-5
Check SWR (standing wave ratio)
Check power output using 1, 10, 100 watt scales
Use the matcher to bring down a slightly high SWR
Unit is in good shape & works well
Supplied with 3 foot coax. jumper
Sorry, no owner/operator manual

Fluke 8600A digital multimeter $45.00
Test-- AC, DC, Ohms, up to 1200 volts
5 digit L.E.D. readout.
Pushbutton function controls.
Supplied with:
New power cord
Test leads
Owner/operator manual
Cosmetics (case) is in fair condition.
Good operating condition
Note: DC volt reading, reads approx. 1 volt higher

than actual received voltage.

All prices are firm and units will be shipped at my expense
in the USA only. I will ship COD , you pay COD charge (approx. $6.00)

Interested?? Contact PANTH18251@aol.com
Thank you...

This message was posted to this newsgroup because it was recommended
by someone or was
given as a resource. If you should know of any other resource which
may be able to help, your
forewarding this post would be greatly appreciated.

The Quebec Committee for Canada is a non-profit, federally-chartered
corporation which
supports Canadian Unity whose goal is to put an end to the political &
economic uncertainty
created by a divisive separatist government in the province of Quebec.
(Further information at
http://www.accent.net/qcc or http://www.qcc.ca)

It is our hope that we may develop solutions to our political dilemma
in peaceful, non-violent
ways.

Unfortunately, there is at least one faction which will not allow
this to be. The MLNQ,
(Movement de Liberation Nationale du Quebec) & its core
agent-provocateur, convicted
murderer & FLQ terrorist of the 60's, Raymond Villeneuve, swear to
violence in their quest to
create an intolerant & ethnocentric state, the Republic of Quebec.
(Learn more at
http://www3.sympatico.ca/scamire - this is a french language only site
-also-
http://www.montrealgazette.com/search97cgi/vtopic?QueryZip=%3CMany%3E%3CPhrase%3E
%28%3CMany%3E%27Raymond%27%2C+%3CMany%3E%27Villeneuve%27%29&ResultTem
plate=mg%5Fsite%5Fresults%2Ehts&QueryText=Raymond+Villeneuve&Collection=mg%5Fsite
&SortField=Score&SortOrder=Desc&ResultStart=1&ResultCount=10&ServerKey=Primary&Admi
nImagePath=&Theme=&Company=Southam&nkey=$$nkey&ResultsTemplate=mg_site_results..
hts).

They have even gone so far as to post a hit-list of, in their minds,
"enemies of the state"
containing the names of numerous federalists.

Now here is our dilemma.

There has been, in the last two weeks, a definate escalation in the
aggressive tactics being
employed by the MLNQ & possibly others who have been influenced by
their calls for violence.

Unity activist Helene Tobin had an incendiary device, gasoline driven, placed at the door of her
Lachine home this week. (Learn more at
http://www.montrealgazette.com/PAGES/971201city1.html -also-
http://www.montrealgazette.com/PAGES/971202city1.html) This follows a rash of vandalism,
mainly graffitti, in which swastikas were painted on people's homes, including the home of
LaSalle city councillor Antonio Massana as well as threats, including, "Death to partitionists".
(Learn more at
http://www.montrealgazette.com/ARCHIVES/971115city1.html

Last week the MLNQ showed up outside a city of Verdun councill meeting to physically &
verbally abuse (push, shove, hit, brawl, utter death threats) unity supporting taxpayers who
wanted no more than to exercise their democratic right to assemble as a community in the town
hall to present their wishes & views. All the while these Brown-Shirts wore masks, a crime in
itself in this province.

The police stood by doing nothing concrete to end the crimes being committed literlly under
their noses. The riot-squad sat in the cafeteria of the town-hall & were never called upon even
though they were sorely needed outside to protect the rights of those wishing to enter their town
hall. This is no suprise (to me) in the least as the police are openly known to be very
sympathetic of the separatist movement (many of them are openly separatist themselves).

Needless to say, there are more than a few nervous members of the unity committees in
Quebec.

I would like to ask you to send me any resources where we may find techniques on how to
keep our membership safe both at rallies/town-hall-meetings & in our daily lives.

Certainly there are some of you out there who have experience or who know people with
experience in the area of grass-roots organization secuity.

Some obvious areas of security have been addressed such as our membership list being in a
safe & unknown place outside our offices. (Only 2 people actually know where the list is)

Some areas I would like to find information on are:

- General crowd control, holding protests.

- Surveiilance in crowd situations incl. photo/videographic techniques.

- Others' experiences with the police with regard to relations with grass roots organizations.

- Greenpeace - Does anyone know if information about their tactics is available somwhere?

- Tactics for self-defense, defending yourself in a crowd, security procedures/techniques for
offices & staff.

- Any Canadian law related information (specificly related please).

I would like to thank, in advance, everyone who responds to this post. Should you respond to
me personally you will certainly receive a response. Please respond via e-mail as well as to the
group.

I invite you to visit the QCC website to learn more about what we are & what we are trying to
accomplish.

Best Regards,

KLB

Assuming you are talking about the display on a scanner, AOR makes a nice
hand held that you can enter alpha-tags to identify your channels (among a
gazillion other features). Be ready to spend some serious cash, they sell
for $500 and up. Not for the faint of heart...

>and I am really enjoyiong it. There are some cosmetic differences
>between the Uniden and the RS, and I prefer way the RS model looks over
>the Uniden.

What I would like to know is how you managed to get a PRO-90 at such a good price. My friend paid $299 for his PRO-90, and even if you have a 10% discount coupon for Rad Shack, the price would still be $269. Is Rad Shack having a sale on the PRO-90, or is the $219.95 price a typo?

Bill,
My question is, are they working on a mobile version? Would it be possible
to build some kind of external version with a cable and card that plugs
into the PCMCIA port of a notebook PC? I'd buy one, and I'm sure that
others would too. You might want to pass that along to WiNRADiO and see
what they say.

Attention All Scannists,
In an effort to provide everyone with the best knowledge available for purchasing a scanning radio, antenna, book or piece of software, I have created a User Opinions page. This page exists for you to post your personal reviews and thoughts of scanning related items.
I ask each and every one of you reading this message to consider the knowledge and experience you have gained from your monitoring and put it towards helping this effort.
No one expects a thesis to be written. Just your honest comments on what you do and don't like about a particular product. It can take but a few minutes yet make such a large impact to those of use who will make use of it.
To anyone who has ever used the Internet to do research before making a purchase, I think you can see how valuable a resource such as this can be.
Several people have already been unselfish enough to post their thoughts about items they have used. I thank you and hope that others will follow your lead.
To learn more, point your web browsers to

http://www.qsl.net/n2mca/OPINIONS.HTM

A few articles have been added recently and I urge the rest of you who may be considering submitting your opinions to just do it!
Thank you for your time and consideration!

Strong signals,
Rich N2MCA http://www.qsl.net/n2mca/

Perri-
Pick up a copy of the Utah Frequency Directory. They are sold at
Spy Headquarters in SLC, and you can also get a copy by mail directly
from em (the editor). Let me know if you'd be interested. The UFD
includes frequencies, radio codes, unit designators, etc.

Thanks,

Dan

Give me a break Bill. As I am sure you know the MILSATs have beacons. With
the amp the beacon IS dead on frequency and no place else that I can tell.
The few times I have heard channel numbers spoken by the operators they
matched the freq I was tuned also. So where have I gone wrong?

> Lots of times, funky preamps will appear to work great when there is
> something wrong with the receiver.....like a misalignment, or a
> blown RF front end.....or even "tinkeritis".

Yea, I guess I am fairly new and clueless to these scanner things. Guess
it means my R-7000 and 2004 both have the same "misalignment, or a blown
RF front end.....or even "tinkeritis". Also means those boys better get
that beacon ans some channels fixed, if I'm off so are they.

> But hey, man, enjoy the hell out of it if you like it. I guess
> this business of preamps is a lot like lady folks. Some guys
> like 'em skinny; some meaty; and some kind of on the heavy side.

It has nothing to do with what I like but what has worked for me. It is
too bad after all this time you feel that I am unable to operate my
receivers/scanners and can't recognize intermod, images, overload,

desense, and such. Sheesh!

> I reckon some guys like their receivers to be bogged down with
> . Far be it from me,
> you crazy old fart, to put down what you like.

Bogged down? What does that mean? I can pretty much hear what there is out there to hear. My logs don't reflect being bogged down. I don't follow, what is bogged down?

So Bill, help me out. I can hear signals on both my R7000 and 2004 with the preamp that I can't without. They aren't ALL images, the frequency of a number of them have been verified. (If nothing else is, the beacon frequency on the sat is a good frequency standard.) Where have I gone wrong? How is this happening?

>
>Also, anyone have/know of a web page with freqs for the above areas

Information is available at http://www.ggw.org/nf2g - just follow the links to Ontario, then the specific areas of interest. My site has primary dispatch information at this time. By the end of January, I will put up complete channelization information for the areas covered.

256. Kansas Column 12-97

Newsgroup: rec.radio.scanner
Date: 1997-12-03 00:00:00 UTC
From: andy <andyb@qni.com>
Message-ID: <3485DA32.6484@qni.com>
Source record: 178693

```
Kansas Column 12-97
```

This month's rundown:
1. KU Med Center's new trunked system
2. More Topeka/Shawnee County TrunkTracker codes
3. DEA update for the KC area
4. Missouri side of KC Metro area FD freqs
5. Kansas state's 800 system progress
6. Global Positioning System for the state of Kansas
7. Larned Juvenile Correction Facility news

---1.

Kirk confirmed a rumor that had been circulation around Kansas City for a while now—KU Med Center is going to a Motorola 5 channel trunked system. His research yielded the following frequencies:
866.0750
866.4125
866.7375
868.2500
868.8000
These are 5 of the 10 NPSPAC frequencies assigned to Wyandotte County. The call sign is WPKL892. I have heard a control channel on 866.4125, and Kirk says he has heard some voice testing. The TrunkTracker didn't do anything when I tried it on that system. There was no doubt that it could hear the control channel, but still it did not lock on or look for talkgroups. I have not tried it in a couple of weeks, so it may be functional by now. Kirk said that all the departments will be on it—PD, housekeeping, maintenance, etc. Word is that there are 15 talkgroups, including some Kansas City Kansas PD and Johnson County North Zone groups. Once they switch, I would recommend leaving in their old UHF frequency (460.2750.) You never know what might be on it in the future.

---

2. Some more talkgroups for the Topeka/Shawnee County/KS Motorola trunked system showed up. Last month's column had a ton of them, so some of these might be repeats or corrections.
Topeka PD Topeka FD
3856 1 East 3408 Main Dispatch Fire 1
3888 2 West 3376 Fire 2
3824 3 Info (tags, etc.) 3440 Fire 3
3632 4 car to car 3216 Training
3760 5 car to car 3280 Inspection
3660 6 CID
3600 10 Surveillance Events
3536 Animal Control 4848 Event 1

3568 School Security 2096 Event 2
4912 Event 3
KHP
144 Main 1
176 2 (probably car to car. All the systems that KHP are on
now have one for that Andy)

Shawnee County Sheriff Capitol Area Security Police
4528 Main 1 720 Main
4592 Car to car 3 752 Car to car
4560 Warrants 2
4620 Detectives Youth Center at Topeka
4752 Animal Control 944 Main
Great stuff again Thanks for the input!
Doyle and Dale had some questions about the frequencies for the Shawnee County/Topeka trunked system. My only source of information on them has been the somewhat anonymous lists that have been showing up. With a little more research I might be able to confirm them, but for now that is all I have. As I went back to check the frequencies in last month s column I discovered that I have misplaced my archived file for the KS Column of 11-97. If any of you have it saved, could you shoot a copy to me? I know it is around here somewhere, but I can t find the darn thing. I forgot to save it to my hard-drive, so my only copy was on the missing floppy and most of you have heard about the way things disappear in my office!

---

3. Bob sleuthed some information on the DEA. He monitors from the Tonganoxie area. Here is a copy of what he sent to me:
"The KC DEA has had a repeater on 418.900 for a long time, but before they started using that frequency they had a repeater on 418.625. I had assumed that they'd simply moved it to the new freq. But last evening I heard someone call in on "channel 1" and looked up to see that I was receiving a very strong (full quieting) repeater on 418.625. Apparently it was left intact and is still being maintained because it was loud and clear. It is possible that it was in Topeka or that tropospheric ducting along a weather front was responsible for the reception, but 418.625 is clearly in use somewhere around here."

---

4. Well, I promised that the column would begin to incorporate some information from the Missouri side of the KC Metro area. The following list is part of what I have for the area. I am acutely aware of most of the Kansas agencies and how they operate since I dispatch for Lenexa PD and deal with many of them on a regular basis. In that respect, I probably have an advantage over the average scanner listener. But when it comes to Missouri agencies we are all on the same level. (OK, maybe I have a little bit of an edge, but not much of one.) I cannot say exactly how accurate or complete my Missouri stuff is. Please let me know of all the mistakes or additions that need to be noted.

BELTON FD 154.400 CASS CO FD 153.845
CASS CO FD 154.355
GRANDVIEW FD 154.430 CASS CO FD 154.400

JACKSON CO FD 154.220 INDEPENDENCE FD 154.310
JACKSON CO FD 154.370
JOHNSON CO FD 154.190
LEES SUMMIT FD Yellow 1 453.900
LEES SUMMIT FD Yellow 3 453.525 KCMO FD DISP 154.130 (old)
LEES SUMMIT FD Yellow 5 453.575 KCMO FD FIREGROUND 154.445 (old)
LEES SUMMIT FD Yellow 7&8 460.350 KCMO FD CAR/CAR 154.010 (old)
KCMO FD KC 800
ODESSA FD 154.415
NKC FD 154.235
RAYTOWN FD 154.370
PRAIRIE TOWNSHIP 460.575
SMITHVILLE FD 154.190
RIVERSIDE FD 154.190
Looking at Lees Summit you will notice that channels 2,4, and 6 are not represented. Does anyone know if these are perhaps talkaround channels on the repeater outputs of channels 1,3, and 5 or what? I do not have any codes or unit numbering systems for any of these departments. Can any of you from Missouri help us out?

---

5. Dale sent a bunch of details on the State's developing 800 MHz system. He has been receiving training on it, and while at Troop C (Salina) he toured the new facility and was impressed. The tour guide was the civilian Lt. that is in charge of the whole deal who said that the Communications Sgts. will probably stay at their respective Troop headquarters so they can do the NCIC certification classes for the local agencies and do some local dispatching. LOCAL DISPATCHING!?!? Yes it seems that there will be a console at each Troop as a backup if (when) a line gets cut between the Troop and Salina.
Washington County (north part of Troop C) is now the focal point for some tower construction. They project that the central region will be up and running by July 1998, and the western part of the state should be completed by July 1999. Central dispatch is supposed to be finished in that same time frame.
Most of the state's 800 stuff is made up of conventional repeaters, but the above mentioned Lt. is trying to talk KDOT into setting it all up as trunked systems in order to simplify operation and add a data channel. There are several problems with the way it is now. With the current design 2 Troopers talking car to car will tie up that repeater and other Troopers cannot talk to dispatch. Not good! Low band is still the preferred choice for car to car for that reason, and also because the 800 car to car range sucks. (Dale's word not mine!) Trunking would eliminate the Troopers from having to remember/guess what tower to use, too. If implemented, the trunked system would follow the Trooper all over the state.
As always, Dale, thanks for the updates.

---

6. I received a note in the mail outlining the GPS (Global Positioning System) for the state that will track the Troopers' locations. Phase 1 was the issuance of the contract for the equipment to Location Technologies Inc. of Parkville, MO. Phase 2 consisted of installing several units in some of Troops B's cars for about a week to see what happened. One unit was on the trunked system, the other on a conventional repeater.
Phase 3, the "design" phase, involved installing the mapping software and hardware. One of the cars usually used the Lawrence conventional repeater (868.8625), while the other one was primarily used on the trunked system.
Here is something that I didn't know about the system that should interest most of us. Not only will the GPS unit allow dispatch to track the car, but it will have various status buttons that will let the Trooper replace routine radio transmissions to dispatch, i.e. arrived at scene, out of service, etc. It is anticipated this will eliminate lots of voice traffic'and lots of the fun of scanning!
Phase 4 is installation, testing and training. Once all the equipment has been installed in cars, on towers and in the comm centers they will light it up. After this pilot GPS program is complete, the rest of the Troops will be next. The system works with low band as well as 800 MHz, so it isn't dependent upon the construction of 800 MHz tower sites.

---

7. Doyle relayed some information he got from a friend that used to be a Trooper. For the most part he confirmed what Dale said about the GPS system, but he added that they will also have laptop computers. I suppose they will use them for reports, accident investigation, (and Solitaire) as well as for voiceless communication with dispatch.
He also mentioned that the new 800 MHz repeater for the Larned Juvenile Correctional Facility is in. As he noted, the word "in" means "in the box sitting in the office." Eventually they will remove it from the box and stick it on the Larned State Hospital tower. The low powered repeater currently in use (851.8375) covers the grounds of the complex, and that is about it. LSH security will remain on the old one when the new repeater is activated.

I used to try to put a little "thank you" at the end of each section that came from someone, but it started to sound a little too sweet and syrup-ie for me. Also, I was running out of clever and unique ways to say it, and started sounding like a broken record. So'to those who sent stuff in, a big group "Thank you!"

Till next month (and next Year!)

Andy

>There are a couple of problems to be aware of. Most AA NiCd's are
>600-700 milliamp hour (mah) capacity. That will run most scanners for
>at most about 4 hours. Alkalines are on the order of 2400mah capacity,
>and Lithium AA (which are not exactly common, and definitely not
>cheap) are close to twice that. They give much longer performance.
>
<<SNIP>>

Another factor to consider (as indicated in a previous post) is current demand. Scanners are fairly low demand, but if you want to power high current device such as lights or transmitters, NiCds are the choice over Alkaline and certainly Lithiums.

Source record: 178696

I recently purchased the Trunk Tracker from Bearcat. I am very confused about programming this scanner. I have owned scanners for years and have never felt this overwhelmed when reading the directions. Is there any place on the net that explains in English how to use this in the trunked mode. Please could someone either e mail me or explain the steps in English. Thanks Stoli126@aol, com

QTH.Net Digests and Archives (for subscribers)
k7on@qth.net

What about Digests and Archives?

A. Digests

All lists at QTH.Net have digests available.

You can subscribe to a digest and periodically receive the compiled
messages rather than individual messages.

All list digests are configured for a size limit of 40,000 bytes.
However, most of the files are around 16k to 30k. This is because
majordomo will NOT send a digest larger than the limit. If a new
message pushes beyond the limit, it sends the accumulated, putting
the new message in the NEXT digest.

If you are switching from non-digest to digest, you must unsubscribe
wyham and subscribe wyham-digest.

It is an entirely seperate subscription, but both digest and non-digest
subscribers are permitted to post to the non-digest list.

TO: majordomo@qth.net
SUBJECT:
BODY: subscribe wyham-digest
unsubscribe wyham

B. Archives

All messages sent via reflector are archived and are available for
access through majordomo.

You can send a command to majordomo@qth.net and in the body type:

index wyham-digest

and get a list of files that are available by request.

Here is an example:

>>>> index wyham-digest
total 116
-rw-rw---- 1 majordom 45 14169 Sep 2 18:09 v01.n042
-rw-rw---- 1 majordom 45 18100 Sep 3 11:27 v01.n043
-rw-rw---- 1 majordom 45 15322 Sep 4 14:11 v01.n044
-rw-rw---- 1 majordom 45 13490 Sep 6 11:15 v01.n045
-rw-rw---- 1 majordom 45 16382 Sep 9 18:39 v01.n046
-rw-rw---- 1 majordom 45 14823 Sep 11 08:40 v01.n047
-rw-rw---- 1 majordom 45 16872 Sep 12 01:04 v01.n048

To retrieve one of these files, send an email to majordomo@qth.net.

In the body of the message, type:

get wyham-digest v01.n048

The file will be emailed to you, automagically!

C. Archives on WWW

You may view the archives online.

Point your web browser to: http://www.qth.net/wyham-digest.archive

Since Toilet Boy is one step above ameoba and on par with rocks on the evolutionary scale, then if he crawled under his rock, wouldn't that be like having his head up his rectum? Judging by the pithy comments Toilet Boy has blessed us with over the last couple of years, he's had his head so deep up his butt that he looks like a Moebius loop just before he inverts in on himself and disappears.

Gee, I guess the engineers at Yaesu, Kenwood, Icom, and Alinco could
learn a thing or two from you, then. Check out their UHF or dual-
band mobile rigs. They all use 259 connectors on them. But hey,
they're designed for the Amateur market, so they must not be
designed by professionals...

Oh, well then both Mini Circuits and my HP Network Analyzer must
be lying then. They spec the minimum gain at 2 GHz to be 11 dB.
I measured 12 dB with my setup. Besides, you originally asked
for something that worked from 25-1300 MHz, and the MAR-6 more
than qualifies. BTW, stripline construction techniques are well
within the realm of the serious hobbyist.

Be that as it may, the analysis clearly shows the potential
benefit of using a wideband preamplifier. That was my intention.
You stated that preamps will ALWAYS screw up your reception. The
analysis PROVES that you are WRONG.

> Ummmmmmmm....like you? If the inference is at me, well....I

> > compression points, and RF environments.
>
> Geezus. Whew! Relief! That's like you finally 'fessing up
> that the damn sky is blue after professing it's polka dotted.
>
Not quite. You took me a bit out of context. I stated that
beginners might want to avoid using preamps because of the
complexity involved in their selection. That's a far cry from
giving in to your original assertion that preamps (in scanning
applications) are ALWAYS BAD.

> > But I don't believe for
> > a minute that the only people that read this newsgroup are entry

>
> No. But 90% of 'em are smack dab in the middle of Metropolitan
> Downtown America.....and the other 10% would be better advised
> to focus on the antenna installation FIRST before monkeying
> around with preamps.......

This sounds a lot more reasonable than a blanket statement that
preamps for scanners don't work period. Are you "fessing up"
and retracting your original statement?

I suggest to use a conventional electrolytic capacitor over the tantalum, because tantalum caps are sensitive devices. When charged with reversed polarity they can explode. As the cap is to be connected to an external connector, there's always the danger of signals/current applied to it by accident.

An electrolytic cap is far more resistant to false treatment, and won't make that much of a mess when eventually dying (although they will not your app most probably).

You paid $675 for a $250 scanner? I don't care if the damn thing is capable of hearing the Bejing Fire Department on simplex, it sure isn't worth what you paid. There may be a mod for the scanner to recieve cell, but for that price I would expect it to already have been done.

Can someone send/post a fairly comprehensive list of NYC scanner frequencies? I'm headed to Internet World and can't find my old copy of ScannerMaster. Help?

Thanks...

David, N5FDL

274. Icom PCR-1000 Questions?

Newsgroup: rec.radio.scanner
Date: 1997-12-03 00:00:00 UTC
From: David Coursey <david@coursey.com>
Message-ID: <665b0u$i4d$1@its.hooked.net>
Source record: 178711

I've just bought an Icom PCR-1000 PC-enabled wide band receiver and would be happy to answer any questions.

Quick bottom line: The PCR-1000 has turned my computer into the world's most expensive scanner. The software works fine but needs additional functionality -- it does PL tones but not digital PL, it will autoload active frequencies but doesn't do "hit" counts to show how active the frequency is, doesn't seem to support database imports or printing. A third party ought to be able to do a great deal with this radio.

The radio is sensitive but not really hot. I have not been able to really test the BCB/HF capabilities. Based on the WinRadio reviews I've seen I think this is probably a better radio, but I have no experience to bear this out.

David, N5FDL

BINGO!

The 3361 IC is in the middle of the main circuit board. Right next to
pin nine is a test point. I wired up a jack to the test point and a
convenient ground, and things are working great.

Thanks for the ingo, Wiggie!

Hello,
I am selling a practically new Mobile 100-channel scanner with 800MHz
and VHF-air Band

PRO-2046
Just touch buttons to explore preset
VHF Police,Weather,DOT,Highway,800 MHz Police/Fire frequencies.
Also provides band search in 12 preset frequency ranges and HyperSearch
direct search-up to 300 steps per minute.
20 programmable search skip frequencies help prevent lockups on
undesired signals.
Mounts under dash with included bracket.
Have original box and manual for the unit.

I am selling the unit for $100.00 + shipping

If interested please email me back... Jeffrey - N9MXT

I have looked around the 'net quite a bit and searched Deja News but have found nothing on the AR 900 handheld. Among the long list of things I don't like about this radio is the very very slow scan rate (never timed it but seems like well under 10 ch per sec.) Does anyone know of a mod to boost it? Thanks!

Kevin P

To the universal MUCKEY...so mucked up (get it?)

The less of you is more of reality. Please cooperate.

Please be kind and end it for yourself. You are a tribute
to what is trite in this NG. The Planet.

I posted the original which I answered. That was my point.
I was not complimenting you, but showing to all who have
brains how insipidly stupid you are....no doubts now.

You took "sarcasm" of mine for affection and attention in a
positive way. You reek morbidity of your mind-stem. It's
going the way of senility a growing

MUCKEY...please get an interpreter: a good second grade
school teacher will do fine. You need somone well qualified
for your reach. Utilize that person to give you your reality
checks. Get it notorized and then allow her or him to show
you how to post to the NG you choose to villify with your
obnoxiousness.

>>> out there for scanners?
>>Well, that depends... what kind of special batteries are we talking about?
There are a couple of problems to be aware of. Most AA NiCd's are 600-700 milliamp hour (mah) capacity. That will run most scanners for at most about 4 hours. Alkalines are on the order of 2400mah capacity, and Lithium AA (which are not exactly common, and definitely not cheap) are close to twice that. They give much longer performance.

You can buy AA NiCd's with higher capacities. I have seen 1000mah NiCds, and NiMh's are available up to about 1500mah, however the built in chargers in many scanners may not be suitable for NiMh. Also NiCds self discharge at the rate of about 1% per day, NiMh's at about 2% per day, so they are kind of a pain if you only take out the scanner and use it once a month.

NiCd's have somewhat lower voltage the Alkalines or lithiums, and it is pretty stable across the life of the battery. most scanners are designed to operate properly at those voltages however. There may be some that are not.

AAA are more troublesome, the capacity on them is typically 180mah, which is about a quarter of the alkaline version, so operating life on them . I don't know of any high capacity AAA's or NiMh's in that size either, so they tend to be short lived. (ask early Apple Newton owners about that).

Emilio:

What you need to do is soak your scanner in a tub of warm water, then
talk to it for about an hour. Once this is done it should start
producing the desired cell conversations for you.

Good Luck!

```
AN OVERVIEW OF THE CE-232 SCANNER/COMPUTER INTERFACE
===================================================

This article is copyrighted (c) 1997 by Bill Cheek. Permission to
reprint for FREE access and FREE use by others is automatically
granted so long as this entire article, including signature box at the
end are retained intact and unaltered.

WHAT IS THE CE-232?
===================

The CE-232 Scanner/Computer Interface is a 2.5" x 3" electronic board
with a socketed 68HC11 microprocessor and seven IC's that goes between
the COM1 or COM2 port of an IBM-PC/XT/AT/386/486/Pentium-compatible
computer and a supported scanner.

The CE-232 is a -smart- RS-232 Interface controller AND powerful data
acquisition system for some scanners and at least a drudgery-free
automatic programmer and remote controller for all supported scanners.

FEATURES AND BENEFITS for all supported scanners
================================================

The CE-232 offers some very powerful capabilities described below:

AUTOPROGRAMMER (all supported scanners)
---------------------------------------

The CE-232 eliminates the drudgery and hard labor of scanning by
its ability to "AutoProgram" up to 999 memory channels from a
plain ASCII text file in a short time, error-free and exactly the
way you want it.

For more information on the AutoProgrammer, see:

Article Title Text filename
========================== =============
CE-232 AUTOPROGRAMMER autoprgm.txt

REMOTE KEYBOARD CONTROL (all supported scanners)
------------------------------------------------

The CE-232 also allows control of the scanner from the computer's
keyboard; a strong plus for handheld scanners and those with
hard-to-operate keyboards, like the PRO-43, PRO-2035 and PRO-2042.
```

The CE-232 is a one-way controller and AutoProgrammer like
described above for MANY scanners, including the PRO-2042,
PRO-2035, PRO-2022, PRO-43, PRO-39, PRO-37, PRO-34, PRO-26, etc.

For more information on the Remote Control feature see:

Article Title Text filename
==================== =============
CE-232 REMOTE CONTROL remctrl.txt

FEATURES AND BENEFITS for the PRO-2004/5/6 Scanners
==

The CE-232 is a TWO-WAY controller and data acquisition system for the
time-honored PRO-2004, PRO-2005, and PRO-2006 scanners which have unique
circuitry that allows the CE-232 to do a LOT more than just AutoProgram and
Remote Control, including log data on "hits", reject undesirable signals,
look up data about a certain frequency, and much more described below.

AUTOLOGGER (PRO-2004, PRO-2005, PRO-2006 only)

The CE-232 acquires and logs data to a file with the AutoLogger
feature. The AutoLogger creates plain ASCII text files that are
easy to export to a database or just to use in original form.
Most every aspect of the scanner's operation can be AutoLogged,
notably including channel, frequency, date, time, and duration of
the transmission; but much more, too.

For more information on the AutoLogger, see:

Article Title Text filename
==================== =============
CE-232 AUTOLOGGER autolog.txt

AUTOREJECT (PRO-2004, PRO-2005, PRO-2006 only)

The CE-232 can AutoReject "birdies" and any other undesired signal
so that the Search and Scan functions won't be disrupted by the
scanner locking onto signals that don't interest you.

For more information on the AutoReject feature, see:

Article Title Text filename
==================== =============
CE-232 AUTOREJECT reject.txt

AUTOLOOKUP (PRO-2004, PRO-2005, PRO-2006 only)

The CE-232 can LookUp and display information about the
frequencies that are programmed into the memory channels. If you
have all 400-channels programmed, or even a hundred, there's no
way to remember right off what each frequency is assigned to. The
AutoLookUp feature can lookup the information and show it to you

on screen, within an instant of the scanner stopping on that signal.

For more information on the AutoLookUp, see:

Article Title	Text filename
CE-232 AUTOLOOKUP	lookup.txt

SCRIPT AUTOMATION (primarily for the PRO-2004/5/6, but can work to a limited extent with other supported scanners)

The CE-232 comes with a Script language of about 40 commands, six operators and a handful of parameters that let you automate the entire process of scanning and searching!

A Script resembles a DOS batch file or a simple BASIC program, but it's easier than either. Automation of scanning and searching doesn't take the fun out of it; to the contrary, it opens up a world of radio that you may never have had the time for in the past.

Scripts can make logical decisions based on IF - THEN - ELSE - AND - OR logic, so "IF this happens, THEN do that; ELSE do something different". There is no real limit as to what you can accomplish by scanning with a Script.

For more information on Script Automation, see:

Article Title	Text filename
CE-232 SCRIPTS	scripts.txt

ENHANCED USER FACILITIES (primarily for the PRO-2004/5/6, but can work to a limited extent with supported scanners)

The CE-232 offers several special features that can't be described very well because they are reserved for the User to decide how and for what they are used. Here is a brief explanation, though:

USER SWITCHES: Four solid state switches are on the CE-232 board for the User's pleasure. These are SPST switches that can be controlled from the PC keyboard, or by automation from a Script. In other words, the User Switches can control a host of other mods and unique circuits. If you want something to be turned on at 3:00AM on September 30, 1998, so be it - a script can do it for you! The status of each User Switch is AutoLoggable for a permanent record.

INPUT STATUS: Six input binary registers or ports are available
on the CE-232 for the User's purposes. The Status
Input bits accept 0v and +5v, and thus, serve a
lot like "idiot lights" in a car. These six bits
are displayed in the main screen of the CE-232
control program. If you need an indicator that can
also be recorded and AutoLogged (like for an
S-meter!), then the Input Status bits will do
nicely!

INBYTE BITS: Eight more input binary bits or ports, exactly
like the STATUS INPUT bits described above, are
available for the User's purposes. The only
difference is that the INBYTES are not displayed
on the main operating screen, though there is
another screen on which their status can be
viewed. Like the Status Input bits, the INBYTES
can be AutoLogged, tested and read by a Script;
and decisions made in an automated manner.

OUTBYTE BITS: Eight output binary bits or ports on the CE-232
board are available for the User's purposes. Just
the opposite of (B) and (C) above, the OUTBYTES
are user-controllable logic-level outputs of 0v
and +5v. If you need a logic bit to turn something
on or off, the OUTBYTES just might be the ticket!

NOTE: each bit of the Status Inputs, InBytes, and Outbytes is
independent of all the rest. No one bit will affect the status of any
other. Therefore, there are 14 Input bits and eight output bits that
are completely available to the User for his purposes. The four User
Switches can be used independently as four separate switches, or
together to create a 4-bit binary "byte" for sixteen combinations of
switches or whatever.

For more information on the User Facilities, see:

Article Title Text filename
==================== =============
CE-232 USER FACILITIES usertool.txt

WHAT ARE THE MINIMUM HARDWARE REQUIREMENTS?

The CE-232 is supported only for the IBM-PC/compatible, however we
know a gentleman who supports it for the Macintosh platform.

The PC platform requires MS-DOS 3.1 or higher, with 512-k RAM (min), a
free COM1/IRQ4 or COM2/IRQ3 port, and a hard disk drive with about
3-Mb of free space. The CE-232 also runs fine in a DOS box under
Windows 3.1, 3.11, and Windows 95. The CE-232 can be configured to run
from a floppy disk for old XT/AT's and old laptops that don't have a
hard drive or not enough free space. Floppy disk operation isn't
especially recommended, but there are situations where nothing else

will work.

The scanner must not have been speeded up by any crystal replacement means. However, diode speedups are okay, as are all other mods that come to mind right off. We do not support "other mods" to work with the CE-232, but only because we have no control over what the User does and doesn't do. But frankly, the only mod we've found over the years that's incompatible with the CE-232 is the crystal-swap speedup.

WHO CAN BUILD AND INSTALL THE CE-232?

Virtually anyone not unduly physically handicapped. Soldering skills are certainly helpful as is a basic savvy of electronics. I have, however, guided many a non-technical hobbyist to success at assembling and installing the CE-232 Interface. The main thing here is PATIENCE and the ability to read and follow instructions in English. Depending on your skill level, free time, and patience, the CE-232 is available in several different ways, one of which will suit most people.

AVAILABILITY

The CE-232 is available in four different ways:

1. Roll your own, by yourself, totally from scratch. The complete plans, schematic diagrams, and PCB layout, including parts list, are presented in my third book, THE ULTIMATE SCANNER (Cheek3) by Bill Cheek, ISBN: 1-56866-058-8. This book is sold by mail order radio dealers around the world, and I carry it, too. (autographed)

2. Roll your own from a professional Kit of all essential parts, including PCB, detailed instruction manual, and program disk. I can supply this Kit.

3. Roll your own from an Assembled and Tested Board, with detailed manual, and program disk. I can supply this Kit, as well.

4. I can do everything, from build the CE-232 to install it in your scanner and test it for proper operation.

For more information on availability and prices, see:

A TUTORIAL ON
THE CE-232 SCANNER/COMPUTER INTERFACE'S
REMOTE KEYBOARD CONTROL FUNCTION

INTRODUCTION
============
The CE-232 Scanner/Computer Interface is a 2.5" x 3" electronic
board that goes between an IBM-PC/compatible computer and a scanner
for a host of very powerful capabilities.

The CE-232 is a -smart- RS-232 Interface controller and data
acquisition system for some scanners and at least a drudgery-free
automatic programmer and remote controller for all supported scanners.

The CE-232 eliminates a lot of the drudgery and labor in scanning by
its ability to "AutoProgram" up to 999 memory channels from a plain
ASCII text file in a short time, error-free and exactly the way you
want the scanner configured.

The CE-232 also allows REMOTE control of the scanner from the computer
keyboard; a strong +plus+ for handheld scanners and those with hard-to-
operate keyboards like the PRO-43, PRO-2035 and PRO-2042!

The CE-232 is a one-way controller and AutoProgrammer like described
above for MANY scanners, including the PRO-2042, PRO-2035, PRO-2022,
PRO-43, PRO-39, PRO-37, PRO-34, PRO-26, etc.

The CE-232 is a TWO-WAY controller, AutoProgrammer and data acquisition
system for the time-honored PRO-2004, PRO-2005, and PRO-2006 scanners
which have unique circuitry that allows the CE-232 to do MUCH more than
just AutoProgram and Remote Control, including AutoLog data on "hits",
REJECT undesired signals, LOOKUP data about a certain frequency, and
much more.

REMOTE KEYBOARD CONTROL OVERVIEW
================================

** Operate the scanner from the Computer's Keyboard! **

REMOTE CONTROL FROM COMPUTER'S KEYBOARD:

Virtually all functions of supported scanners can be operated from the PC keyboard. If you have club fingers like I do, this is almost a vital necessity. I just love my PRO-43 but I loathe operating its keyboard.

The CE-232 displays a replica of the scanner's front panel on your monitor along with a keypad emulator to show the keys to be pressed as if you were operating the scanner in a normal manner. The Figure just below is a reasonable facsimile of the main operating screen of the CE-232:

```

================================================================================
```

This Figure doesn't really do justice because of the difficulties of showing screen graphics in an ASCII text message like this newsgroup article. But you get the idea? Well, just in case you don't, in the above example, to operate the scanner from the PC, you'd press <M> for MANUAL; <E> to change SPEED; <O> to change MODE; and <T> to change the STEP increment, etc. For Remote Keyboard Control, the above screen is mostly just a guide to indicate which PC keys control which scanner functions.

That's really all there is to Remote Keyboard Control of a scanner using the CE-232 Scanner/Computer Interface. If you can operate the scanner from its own keyboard, then you can be more efficient and relaxed operating it from the PC's keyboard.

NOTE: The CE-232 does not slow down the scanner nor alter its peformance in

any manner! Not only can you operate the scanner from the computer's keyboard,
you can also operate normally from the scanner as well. You can even "mix"

operations alternatingly between the scanner's keyboard and the PC's.

NOTE FOR PRO-2004/5/6 ONLY: As the scanner operates, the computer monitor displays EVERYTHING that the scanner shows in its LCD display. For all other scanners, that part of the monitor display is just blank. Remote Control is

as described, however.

UNDERSTANDING AND MAKING AUTOPROGRAMMER FILES
FOR THE CE-232 SCANNER/COMPUTER INTERFACE

One of the singular greatest advantages and features of the CE-232 Interface is its ability to AutoProgram a scanner's memory banks with FREQUENCIES by CHANNEL NUMBER and other custom settings of MODE, DELAY, and LOCKOUT. Beauty lies in the simplicity by how this is done; that is, from a plain ASCII text file. No proprietary or complex formats here, Bunky; just plain ASCII text. The CE-232 uses a variant of plain ASCII text called a comma-delimited format, but which we call an AutoProgrammer or *.APF file.

If you don't know about ASCII text, there isn't much I can do in this limited space and forum to help. But I will clarify to the extent that any files created with Windows NOTEPAD.EXE or MS-DOS's EDIT.EXE, or (heaven forbid) EDLIN.EXE will, most assuredly, be plain ASCII text files. Most text editors and even word processors are capable of creating plain ASCII text files, but you have to be cautious with word processors because they usually embellish text for printing. The printer control codes, fonts, and other embellishments take this type of text out of the plain ASCII category.

1. The cardinal rule for CE-232 AutoProgrammer files is that they must be in plain ASCII text format (like *.TXT, except that we use the *.APF extension.)

You really need to know a little something about data, databases, data organization, and logic, too. Nothing real weird or horrific, mind you; just some basics. After all, your AutoProgrammer (*.APF) files really are databases if you want to get technical about it.

The simplest of all databases is a table. You know, a block of information, organized into meaningful rows and columns. Now here is the only real technical part to understand and remember: rows are really called records, and columns are really called fields. Here is an example of a table that will mean something to you:

TABLE 1: A FREQUENCY TABLE
A B C D E F G
1 7 21 168.0110 nfm D L Audio Intelligence (Body Bugs);Yellow
2 7 22 168.0620 nfm D L Audio Intelligence (Body Bugs);Green
3 7 23 168.0860 nfm D L Audio Intelligence (Body Bugs);Blue
4 7 24 171.6500 nfm D L Audio Intelligence (Body Bugs);Red
5 7 25 171.9500 nfm D L Audio Intelligence (Body Bugs);Silver

Obviously, this is a frequency table. Rows 1-5 are just Records 1-5. Columns A-G are just Fields A-G. With exceptions of Fields A, B, E, and F, you can tell at a glance what all this information means. Now consider that Field A is an identifying group number for this table of frequencies. Field B is the program channel number. Field C, obviously, is the frequency. Field D is the mode setting for that frequency. Field E is an indicator of Delay setting (D if set; blank if not). Field F is an indicator of LockOut setting (L if locked out; blank if not). Finally, Field G is a description. What more do you need to know about a frequency table?

Well, there are a couple of minor things, like limits and restrictions. You'd have a problem making any sense out of the table if the columns or fields weren't the same width, which necessarily restricts the amount of information that a field can hold. Physical width is usually the criteria for fields in tables printed on paper. Number of characters per field is the criterion for computer tables. There are restrictions and limits for all tables of information, and *.APF files are no different.

2. A *.APF file must consist of one or more lines, each to contain not more than 255-characters, maximum. Each line, properly called a record, must end with a carriage return <CR> and a line feed <LF>. (This is normal for text files.)

3. *.APF files are organized just like tables on paper, except that instead of spaces or lines between columns or fields, commas are used to separate one field from the next. Six fields of information are required by a *.APF file with definitions, limits, and restrictions shown as follows:

Field A: (Alpha/numeric; 0-12 chars, max); an optional "filter" field. Used to identify a record or group of records. For example, you might have several different frequency files and want to tell at a glance which record belongs to which group. GOV-DEA might be a chosen identifier for "Government-Drug Enforcement Administration" frequencies.

Field B: (Numeric; 0-3 chars, max); an optional "channel number" field; denotes the channel number that should be programmed with this record

Field C: (Numeric; 9 chars, max); the required "frequency" field, best organized as four digits, decimal, and four more digits, such as: 0121.5000 although any format accepted by your scanner is fine. This could include any of the following: 121.5 121.50 etc. It wouldn't hurt to get in the habit of entering all your frequencies in the "4-dot-4" format, which helps the numbers line up for best visual effect. Leading zeroes are acceptable in Fields B and C, like: 025 and 0171.6500. Leading zeroes help align data and make it look better.

Field D: (Alphameric; 0-3 chars, max); optional field for Mode setting. Only four entries are legit: <blank> which tells the scanner to use the default mode for that frequency, or <nfm>, <am>, or <wfm>. Some scanners, like the PRO-43, won't recognize the <wfm> setting, so it may or may not matter what you put in this field.

Note: What matters is that any entry in this field must be lower case, due to a bug in the CE-232 program. Upper case is ignored. Mode is the only case-sensitive field.

Field E: (Alphameric; 0-1 char, max); optional field for Delay setting. Two entries are legit: <blank> which turns off the Delay, or <D> which turns it on.

Field F: (Alphameric; 0-1 char, max); optional field for LockOut setting. Two entries are legit: <blank> which turns off the L/O, or <L> which locks out the channel.

Fields G and up: (Alphameric/numeric; no special limits other than no line or record can exceed a total of 255 characters, including the total of Fields A-F.) Fields G and up are purely optional and can be in any format or logic that suits your fancy.

4. A CE-232 AutoProgrammer file requires six commas, at a minimum, but ignores any more than six. Commas are used to separate one field from the next. Commas are separators; not starts and ends. The six fields are required in the following form:

aaaaaaaaaaaa,bbb,cccc.cccc,ddd,e,f,g-z.....doesn't matter

Six commas and a legit entry in Field C are required for APF files, but the other five fields are optional. Table 2 shows a minimum legit APF file created from Table 1:

TABLE 2: MINIMUM LEGIT APF FILE

```
,,168.0110,,,,
,,168.0620,,,,
,,168.0860,,,,
,,171.6500,,,,
,,171.9500,,,,
```

Table 3 is all the data in Table 1 converted into an APF file:

TABLE 3: APF FILE FROM TABLE 1

```
7,21,168.0110,nfm,D,L,Audio Intelligence (Body Bugs);Yellow
7,22,168.0620,nfm,D,L,Audio Intelligence (Body Bugs);Green
7,23,168.0860,nfm,D,L,Audio Intelligence (Body Bugs);Blue
7,24,171.6500,nfm,D,L,Audio Intelligence (Body Bugs);Red
7,25,171.9500,nfm,D,L,Audio Intelligence (Body Bugs);Silver
```

Summary: The CE-232 AutoPrograms a scanner with a plain, comma-delimited ASCII file, with six required commas, ignoring any more than six. Any single line or record is limited to 255 characters, with additional limits on the length of each field as discussed above.

CREATING APF FILES
==========

THE HARD WAY: The simplest (hardest) way to create an APF file is to type it using a text editor like NOTEPAD, EDIT, QEDIT, etc. You can use a word

processor if you unfailingly remember to SAVE AS a plain ASCII textfile when you're done editing. Do not insert End Of File (EOF) codes, nor any other codes, for that matter. Never use weird symbols and characters in your APF files, (just regular keyboard characters, please!) Follow the rules and limits as discussed. When done, save or rename the file as <filename.APF>.

EASIER WAYS: Of course, typing your APF files is a lot of work. Fortunately, there are better ways to create APF files, even if not quite as simple. If your frequency records are in a formal database or spreadsheet, it's a cinch to export some or all the data to a textfile format as required by the CE-232's AutoProgrammer. Therefore, it could be "smart" to structure any formal databases to start with the first six fields as required by the CE-232. This will simplify the export of data to APF format. The export functions of most database managers and spreadsheets are self-guiding and explanatory. I prefer MS-Access, Excel, and Works.

The premier supplier of FCC frequency databases is:

PerCon Corp
4906 Maple Springs / Ellery Rd.
Bemus Point, NY 14712
716-386-6015; Fax: 716-386-6013;
Email: sales@perconcorp.com
Web: http://www.perconcorp.com

PerCon's software just happens to have an export feature that makes APF files for the CE-232 "on the fly" as you need them. Press a few buttons, and presto! You'll have most any desired number and size of APF files!

Another great source of frequency data is via the Internet and a huge, but hodge-podge assortment of public messages, BBS and FTP files that contain frequency data. At first glance, you might think this junk needs retyped to be of any use as an APF. Wrong! Enter Reid Drummond and his magnificent program called APFTools; a very low-cost shareware utility that can "read" a nasty, disorganized text file containing frequency information, and output a perfectly organized APF file, ready to go into a scanner via the CE-232! APFTools is easy to use and is affordable by the tightest budget. APFTools is available from my FTP sites in the \pub\montimes directory, or from the author by e-mail at: Reid.Drummond@jpl.nasa.gov

Computer Aided Technologies (of ScanCat fame) offers MAGIC, a frequency extraction program similar to APFTools, that prepares orderly APF files from loathsome, disorganized text files. For details, get MAGIC.ZIP, a demo, from our FTP site or contact

Computer Aided Technologies
PO Box 18285
Shreveport, LA 71138
E-mail: scancat@scancat.com
Web: http://www.scancat.com
phones: 888-722-6228; 318-687-4444 fax (318) 686-0449

Take your pick; both APF extractors are good, and both make quick work of extracting frequency information from text files and converting that data into ready-to-use APF files. Beats the heck out of typing!

Concluding, here is a real world example of an APF file that follows the rules, but varies in detail and style.

TABLE 4: A REAL APF FILE

```
1 MilAir,0182,0395.900,am,D,L,Blue Angels - Air to Air Channel
2 ,183,362.6,am,D,,Air Show Control
3 Emrg,184,0243.00,am,D,L,Emergency/MayDay/Distress/ELT
4 ,185,0,,,L,
5 MilAir,,121.9000,am,,,Blue Angels - Ground Support
6 ,002, 123.4,wfm,D,L,Blue Angels - Airshow Common
7 File3,03,141.560,,D,,Blue Angels - Maintenance Charlie
8 Bank1,4,142.000,,,L,Blue Angels - Maintenance Alfa
9 ,,143.600,,D,,Blue Angels - Maintenance Channel 10
10 blangel.apf,,143.000,nfm,D,L,Blue Angels - Maintenance Bravo
11 Block2,169,0241.400,am,D,,Blue Angels - Air to Air Channel
```

Table 4 is a real world APF file except for the line numbers given for clarity. Line 1 uses most everything that can be used, including a descriptive "filter" field. Line 10 uses a filename for the filter. Line 6 shows leading zeroes and a leading space. Line 4 is about as simple as it gets. Each line shows something unique, but it's all legit APF technique! You don't especially want to mix techniques, like leading zeroes or spaces in one case and not in another, but that's a matter of personal preference - not technical. The CE-232 has other features, like LookUp that suggests the worthwhile effort make the data line up for visual impact. Leading zeroes or spaces in the first six fields contribute to good looks without a negative effect.

This short document should give you all the tools you need to make AutoProgrammer files for your CE-232 Scanner/Computer Interface. If you have any questions or difficulties, tech support is always available on my Web and FTP sites as well as by e-mail. See my signature box below for details.

A TUTORIAL ON
THE CE-232 SCANNER/COMPUTER INTERFACE'S
AUTOLOGGER FUNCTION

INTRODUCTION
============
The CE-232 Scanner/Computer Interface is a 2.5" x 3" electronic
board that goes between an IBM-PC/compatible computer and a scanner,
for a host of very powerful capabilities.

The CE-232 is a -smart- RS-232 Interface controller and data
acquisition system for some scanners and at least a drudgery-free
automatic programmer and remote controller for all supported scanners.

The CE-232 eliminates a lot of the drudgery and labor in scanning by
its ability to "AutoProgram" up to 999 memory channels from a plain
ASCII text file in a short time, error-free and exactly the way you
want the scanner configured.

The CE-232 also allows control of the scanner from the computer's
keyboard; a strong plus for handheld scanners and those with hard-to-
operate keyboards like the PRO-43, PRO-2035 and PRO-2042!

The CE-232 is a one-way controller and AutoProgrammer like described
above for MANY scanners, including the PRO-2042, PRO-2035, PRO-2022,
PRO-43, PRO-39, PRO-37, PRO-34, PRO-26, etc.

The CE-232 is a TWO-WAY controller and data acquisition system for the
time-honored PRO-2004, PRO-2005, and PRO-2006 scanners which have unique
circuitry that allows the CE-232 to do MUCH more than just AutoProgram
and Remote Control, including AutoLog data on "hits", REJECT undesired
signals, LOOKUP data about a certain frequency, and much more.

AUTOLOGGER OVERVIEW
===================
The CE-232 can AutoLog for virtually unlimited periods of time, any
and all activities encountered by the scanner, regardless of mode.
Each -event- (started by a squelch break) is logged to a plain ASCII
text file as a line of data containing the following information
at a minimum:

CHAN/SRCH BANK: a number
FREQUENCY: in MHz
MODE: AM, NFM, or WFM
DELAY: status, (D) set or (blank) not
LOCKOUT: status, (L) set or (blank) not
FUNCTION: Prgm, Man, Scan, Search Up, Search Down
STEP: Search increment, kHz, if applicable
DATE: of event (YYMMDD)
START TIME: of event (HHMMSS)
DURATION: of event (HHMMSS)
(and more): several *user-definable* parameters including
but not limited to S-metering; Extended Memory
Block usage; on/off status of the User Switches,
and much more.

Autologging can be turned on or off at will, manually or even by
automated means with logical operators using the Script function.
Autologged files are automatically opened and named with a date/time
logo, similar to:

96070812.LOG meaning: 1996, July 8, 12th hour (noon).LOG.

Each hour, a new log file is opened and the old one closed & saved.

Autolog files can be AutoProgrammed back into the scanner's memory
at will with no manipulation or changes; just the press of a couple
of keys! This means that you can do a SEARCH function all night or
day while you're away and then at your leisure, AutoProgram in each
new found frequency quite simply, hands-off, in a matter of minutes!

The AutoLogger is a feature exclusive to the PRO-2004/5/6.

DETAILS
=======
The CE-232 AutoLogger feature allows the user to automatically log
all activity detected and processed by the scanner during a period
that starts when SQuelch breaks and ends when SQuelch resets. The F9
key controls the AutoLogger function. The Setup utility (F6) lets
you to specify a drive and path for AutoLog (*.LOG) files.

FILENAME: The AutoLogger composes its filename at the start of a Log
session, using current year, month, date and hour, in this format:

YYMMDDHH.LOG (eg: 97091622.LOG)

where: YY = Year (1997)
MM = Month (09 = September)
DD = Day (16th)
HH = Hour (22 for 2200) (22nd hour of the day or 10:00pm)
.LOG = Fixed default extension - you can't alter it. A new
*.LOG file is created and opened at the start of
each hour! The previous *.LOG file is then closed.

AutoLog entries are not written to the file until complete (ie; activity stops). If start and stop times are in different hours then the entry is recorded based on the start time of the entry. Turning the AutoLogger off before activity stops results in the entry being recorded with the current time as the stop time. This is handy for making quick notes about an interesting signal - just turn the AutoLogger on then off to record data concerning that signal to the current AutoLog file.

NOTE: The AutoLogger does not recognize activity unless it lasts longer than five internal updates or CPU counts from the scanner (just a fraction of a second). This is to allow the display to settle and avoid incorrectly formatted entries. It also allows time for CE-232's AutoReject feature to reject a signal before attempting to log it. Script files that call the IDLE command to control the AutoLog function should use the form:

IDLE UNTIL COUNT = n {where n is the desired number of counts}

Six (6) is a good Count number (5 or lower can result in inaccuracy)

An option is available to log Extended data. Extended data consists of the auxiliary hardware inputs and outputs (OUTSW,INSW,OUTBYTE,INBYTE). This could be useful if you have extra channels via a bank switch memory expansion scheme controlled by the CE-232 Interface's hardware ports. S-Meter readings can also be logged in this fashion. The Extended data can then be used to tell you which bank the frequency was in when detected.

AutoLog entries are recorded in a text file, one line per detected event, usually based on squelch opening for starts and squelch resets for end of record. The following format is used:

Standard Logging Format: (Essential data desired by most scannists)

A,BBB,CCCC.CCCC,DDD,E,F,GGGG,HHHH,IIIIII,JJJJJJ,KKKKKK, <--Format
A| B | C | D |E|F| G | H | I | J | K | <--Field
1, 3 , 9 , 3 ,1,1, 4 , 4 , 6 , 6 , 6 , <--# chars

Example STANDARD AutoLogged lines in a file:

A B C D E F G H I J K
, 3, 142.0250,nfm, , ,SrUp, 5,970916,221230,000003,
, 3, 142.3250,nfm, , ,SrUp, 5,970916,221238,000005,

Explanation

A - Reserved field consisting of one character which is always logged blank by the AutoLogger; used by the AutoPrograming function only and can be up to 12 characters. Retained in the AutoLogger file solely for compatibility with AutoProgrammer files.

B - This field consists of three characters and represents the channel number or search bank number. (See Field G)

C - This field is the frequency and consists of nine characters
(including the decimal point).

eg: 1234.6755 (MHz)

D - Receive Mode (wfm, nfm, am); three characters

E - Delay: (blank = delay off , D = delay on); one character

F - LockOut: (blank = LockOut off , L = LockOut on); one character

G - Op Mode: Scanner Operating Mode: three or four characters as
shown below:

SrUp: Search up
SrDn: Search down
Prgm: Program
Man: Manual
Scan: Scan

H - Search Step (kHz): one, two, or four characters, including decimal:

5 12.5 50 or 30

I - Date: six characters: YYMMDD

J - Start Time of signal: six characters; 24 hour format (HHMMSS)

K - Duration of signal: six characters; 24 hour format (HHMMSS)

L-O Extended Logging Format Option: (Optionally added to end of
above AutoLog format)

| Standard Log |<-----Extended Log Data----->|
| Data from above ,LLLL,MMMMMM,NNNNNNNN,OOOOOOOO,
| A thru K | L | M | N | O |
| 44 , 4 , 6 , 8 , 8 ,<----# of chars

Example of Standard plus Extended AutoLogged lines in a file:

<----------------Standard---------------------------->|<---------Extended---------->|
A B C D E F G H I J K L M N
O
, 3, 142.0250,nfm, , ,SrUp,
5,970916,221230,000003,0001,100101,00100100,01100110,
, 3, 142.3250,nfm, , ,SrUp,
5,970916,221238,000005,0110,100111,00011101,01001010,

Explanation

L - OUTSW: Status of the four User Switches; 4-chrs; 0=off; 1=on

M - INSW: Status of the 6 user Status Inputs; 6-chrs; 0=low; 1=high

N - OUTBYTE: Status of the 8-bit Output port; 8-chrs; 0=low; 1=high

O - INBYTE: Status of the 8-bit Input port; 8-chrs; 0=low; 1=high

Note: It is easy to "export" AutoLog files to a database manager or spreadhseet. Database and spreadsheet programs have the ability to import and export comma-delimited ASCII text files in the formats used by the CE-232's AutoProgrammer and AutoLogger.

The AutoLogger can also print its output to paper; a feature useful primarily with dot-matrix printers since one line at a time is printed with a carriage return <CR> and a line feed <LF>, (but not a form feed) immediately after an event is recorded. Pro-shops and control rooms find this a useful feature; hobbyists may or may not.

SUMMARY AND CONCLUSION
======================

The CE-232's AutoLogger function creates comma-delimited databases "on the fly" that can be immediately used as AutoProgrammer files, or can be imported by a database or spreadsheet of choice. Database and spread-sheet programs readily accept comma-delimited files. This affords superb opportunity for labor-free data processing and other record keeping to support hobbyist and commercial scanning applications. It's a cinch to evaluate days or even weeks' long search results and spectrum studies.

A TUTORIAL ON
THE CE-232 SCANNER/COMPUTER INTERFACE'S
AUTO-LOOKUP FUNCTION

INTRODUCTION
============
The CE-232 Scanner/Computer Interface is a 2.5" x 3" electronic board that goes between an IBM-PC/compatible computer and a VHF-UHF scanning receiver for a host of powerful capabilities.

The CE-232 is a -smart- RS-232 Interface controller and data acquisition system for some scanners and at least a drudgery-free automatic programmer and remote controller for all supported scanners.

The CE-232 eliminates a lot of the drudgery and labor in scanning by its ability to "AutoProgram" up to 999 memory channels from a plain ASCII text file in a short time, error-free and exactly the way you want the scanner configured.

The CE-232 also allows REMOTE control of the scanner from the computer keyboard; a strong +plus+ for handheld scanners and those with hard-to- operate keyboards like the PRO-43, PRO-2035 and PRO-2042!

The CE-232 is a one-way controller and AutoProgrammer like described above for MANY scanners, including the PRO-2042, PRO-2035, PRO-2022, PRO-43, PRO-39, PRO-37, PRO-34, PRO-26, etc.

The CE-232 is a TWO-WAY controller, AutoProgrammer and data acquisition system for the time-honored PRO-2004, PRO-2005, and PRO-2006 scanners which have unique circuitry that allows the CE-232 to do MUCH more than just AutoProgram and Remote Control, including AutoLog data on "hits", AUTO-REJECT undesired signals, AUTO-LOOKUP data about a certain frequency, and much more.

AUTO-LOOKUP OVERVIEW
====================

** CE-232 offers a LOOKUP feature for ID of signals! **

The CE-232 sports a LOOKUP function to display data in a screen table for the active frequency every time the scanner STOPS on a

signal! Your previously prepared AutoProgram (*.APF) File can do
nicely for this file, if it contains the kind of information useful
for a LookUp function. It will display whatever is in that file for
that frequency! Great for instant identifications of the signals
received by your scanner!

AutoLookUp is PRO-2004/5/6 feature only.

AUTO-LOOKUP DETAILS
==========

The AutoLookUp function searches a LookUp file (when SQuelch breaks)
for the frequency in the scanner's LCD display at that moment and
shows a section of the LookUp file including the line that contains
THAT frequency. The line containing the active frequency is high-
lighted for maximum visibility.

The below Figure is a reasonable facsimile of the LookUp screen of the
CE-232's display when the scanner stops on a frequency found in the
LookUp file:

```

================================================================================
```

Obviously, the LookUp feature is not especially useful for SEARCHing
unless either you have one monstrous database/LookUp file (the RF
spectrum is huge!), or you do small and narrow searches that can be

covered more easily by a LookUp file. Frankly, no one of whom I'm aware uses the AutoLookUp function for Searches, but we use the heck out of it for scans.

AutoLookUp is ideally suited for SCANs when the frequencies are first AutoProgrammed into the scanner from a *.APF file. In this case, the *.APF file can also serve as the LookUp file.

Remember that an AutoProgrammer file consists of a plain ASCII comma-delimited text file and the CE-232 requires only the first six fields (commas), so you are free to add amore fields to suit your heart's content. The Figure above shows a display of seven records from my AutoProgrammer file. The scanner had stopped on Channel 26, at 47.5000 MHz, and the AutoLookUp function called up the file and positioned it so that the entry for 47.5000 MHz is in the middle of the screen and highlighted by a contrasting color (not shown here.) We see that 47.5000 MHz is what I call an EMERGency frequency and is used NATionwide by the Red Cross.

As soon as the scanner takes off and stops on a new channel, the scenario is repeated with a display for that new signal. It happens very quickly, usually faster than you can think about it. The only time-delay in LookUps that I ever noticed were when I ran my CE-232 on an old PC-XT/clone running at 4.77 MHz. Even so, it was still pretty fast. 386 computers and better perform like lightning on AutoLookUps, so you're probably well fixed in that department.

Pressing F3 pops up the LookUp Menu. Available selections include:

Enable LookUp - Toggles the LookUp feature on and off. A LookUp file must be designated before enabling this function. If no file is designated you will be asked to pick one.

Designate File - Allows the user to pick a file in which to perform LookUps. If a file is already designated, a new file may be chosen with this selection.

Option: ignore trailing 0's - This option, if enabled, strips the trailing zeros from the scanner's frequency & search the file again if no match was found the first time. This is useful if your LookUp file lists frequencies without trailing zeros (eg: 120.5Mhz instead of 120.5000 Mhz).

The LookUp Page is automatically displayed whenever a match in a file is found. For starters, an AutoProgram File (*.APF) can serve admirably as a LookUp File, too! Just make sure it has all the desired data that you need, organized however you like, AFTER the 6th comma (everything before the 6th comma belongs to the CE-232).

Any text file may be designated as a LookUp file and enabled from the LookUp menu (F3). This feature works best with a hard drive, small LookUp files, and frequencies exactly like the scanner displays, (padded to 4-decimal places with trailing zeros).

If the "ignore trailing zeros" option is enabled, the function searches the file for an exact match with the freq in the scanner's format then searches the file again with the trailing zeros removed. If the searched frequency is 156.750 then this option will find 156.755 if it occurs in the file before 156.750 since it is actually looking for 156.75.

Note: The file must be a text file. Other formats, including databases, contain embedded control characters that cause unpredictable results and probable errors.

AutoLookUp Limitations

The LookUp file must be a plain text file (no embedded control characters other than CR, LF, & Tab). It has been tested up to a file size of 280K. It took approx 3 seconds to find the last entry and display it, using an old Amiga computer running in MS-DOS mode. The larger the file the longer it will take to find freqs near the end of the file. The test file was an AutoLog file, block copied, over and over, to the largest possible size and a unique entry put in last. Squelch was broken on the last freq in the file and an approximation made on how long it took to find it. Slow computers (XT's) will take longer; fast ones (386SX & up) are like lightning. It is also possible to create a RAM disk in Extended Memory and run your LookUp, Reject & *.APF files from there for somewhat better performance, especially compared to floppy & hard disks. There is no need to use a RAM disk with 386DX and faster computers.

SUMMARY AND CONCLUSION
======================

The CE-232's AutoLookUp function will quickly search and display from your frequency database a record for the active frequency in the scanner's LCD display. A quick glance at the highlighted finding on the monitor lets you see whatever information is associated with that "event", "hit", or stop by the scanner.

EPILOGUE
========

The utilitarian functionality of the AutoLookUp feature is largely dependent on the quality of your frequency databases. If you don't have any information, then the computer can't find what isn't there.

Therefore, it is incumbent on the operator to prepare good files, and fortunately it's not the difficult task it may once have been. The PerCon Corporation sells the FCC Database on CD-ROM and they include a utility to convert desired data to the CE-232's *.APF format, lightning quick, no fuss, no muss.

There are a number of other tools to make life easier when it comes to preparing and compiling your own frequency databases. Two of which come to mind include Reid Drummond's APFTOOLS and Computer Aided Technologies' MAGIC. Either of these programs will zip through a disorganized text file of frequency information and output a neat, clean, and ready-to-go *.APF file for the CE-232. The shareware APFTOOLS and a demo of the commercial MAGIC are available on my FTP site at: ftp.204.210.11.126 in the \pub\montimes directory. You can also e-mail to: Reid.Drummond@jpl.nasa.gov for info about APFTOOLS, and for MAGIC, contact: scancat@scancat.com

Another great tool for database work is Microsoft's WORKS for Windows, now in v4.0. WORKS comes with an integrated word processor, database manager, and spreadsheet, just the prime ticket for working with larger volumes of data. WORKS is very inexpensive, too, and has the power to run a small business from stem to stern, so it has plenty of power for the hobbyist.

A TUTORIAL ON
THE CE-232 SCANNER/COMPUTER INTERFACE'S
AUTO-REJECT FUNCTION

INTRODUCTION
============
The CE-232 Scanner/Computer Interface is a 2.5" x 3" electronic board that goes between an IBM-PC/compatible computer and a VHF-UHF scanning receiver for a host of powerful capabilities.

The CE-232 is a -smart- RS-232 Interface controller and data acquisition system for some scanners and at least a drudgery-free automatic programmer and remote controller for all supported scanners.

The CE-232 eliminates a lot of the drudgery and labor in scanning by its ability to "AutoProgram" up to 999 memory channels from a plain ASCII text file in a short time, error-free and exactly the way you want the scanner configured.

The CE-232 also allows REMOTE control of the scanner from the computer keyboard; a strong +plus+ for handheld scanners and those with hard-to-operate keyboards like the PRO-43, PRO-2035 and PRO-2042!

The CE-232 is a one-way controller and AutoProgrammer like described above for MANY scanners, including the PRO-2042, PRO-2035, PRO-2022, PRO-43, PRO-39, PRO-37, PRO-34, PRO-26, etc.

The CE-232 is a TWO-WAY controller, AutoProgrammer and data acquisition system for the time-honored PRO-2004, PRO-2005, and PRO-2006 scanners which have unique circuitry that allows the CE-232 to do MUCH more than just AutoProgram and Remote Control, including AutoLog data on "hits", AUTO-REJECT undesired signals, LOOKUP data about a certain frequency, and much more.

AUTO-REJECT OVERVIEW
====================

** CE-232 rejects "birdies" and other undesired signals! **

The CE-232 can AutoReject "birdies" and other undesired signals when the scanner stops on them, say during a SEARCH. Birdies, pagers,

computer data, IMTS tones, and dozens of other kinds of obnoxious non-voice signals infiltrate every nook and cranny of the RF spectrum. The CE-232, however, can do something about those signals that disrupt your scans and searches!

The AUTO-REJECT function "rejects" (prevents the scanner from locking on) any frequency in a "Reject List". The List is initially empty, but can be loaded from a file or added while on-line (or both). Press F7 to pop up the Reject Menu. The available controls are as follows:

Reject listed activity - toggles Reject checking on and off; must be ON to enable rejection of unwanted signals, however, it does not have to be on to perform any other Reject List functions.

Add freq - Select this item to add the currently displayed scanner frequency to the Reject List.

Clear freq - Clears the last freq on the Reject List.

Save - Saves Reject List to a file. The user is asked for a filename.

Load - Loads the Reject List from a file.

Erase list - Erases the entire list.

View Reject List - This item pops up a window showing the Reject List. Selected frequencies may be deleted and the List saved while viewing the List.

The Reject List file format is described in DETAILS below.

Auto-Reject is a feature available only to the PRO-2004/5/6.

AUTO-REJECT DETAILS
==========

You can do like I did.....disconnect the antenna; set the ATT switch to the -10 dB position and do a SEARCH from 25 MHz - 1300 MHz with the AutoLog feature ON. (Or, you can automate that task with a Script called BIRDFIND.SCR). About two hours later, you'll have a file that contains just the BIRDIES in your scanner! Now you edit and rename this file to something like BIRDIE.REJ, and the next time you do a frequency or band Search, you can specify the CE-232 function called AUTO-REJECT, that prevents the scanner from locking or stopping on "birdies".

But that's not all! You can easily insert other undesirable frequencies into the BIRDIE.REJ or another *.REJ file, so not only can you EASILY make the scanner forever reject birdies, but also pagers, data channels and other obnoxious signals that you don't want to monitor or even log!!!

The Reject function automatically "rejects" (resumes scanning or searching) when activity is detected on a frequency that is on the Reject List. The List is initially empty and may be loaded from a file and/or added to while

the program is running.

NOTE: A quick and easy way to add a specific frequency to the Reject List is to pick a channel in Program mode and enter the desired freq. Then select

the Add Freq item above. After adding the freq to the list, another freq may

be entered into the same channel and the process repeated. An entire list can
be developed this way if desired. Don't forget to save the list if you want to keep it. The program will NOT prompt you to save the list.

The AutoReject feature is most applicable in the Search mode. It is also operable in Scan mode (somewhat silly unless the user is in the peculiar habit
of programing birdie frequencies). The file format is simple: one frequency

per line. The following is an example of a valid *.REJ file:

80.0200
84.0200
87.2500
101.0000
104.0500
108.0250
112.0250

Piece of cake, actually.

Once a *.REJ file is loaded, the AutoReject function can be turned on and off at will from the main menu. The loaded reject frequencies will remain in memory until it is erased or a new Reject File is loaded. The Reject File must be a text file with one frequency per line and no comments or other text. The frequency must be in a form identical to the way the scanner shows it (ie; padded to four decimal places with trailing zeros).

The user may lock-out over 32,000 (depending upon available memory) unwanted

frequencies. When the scanner stops on an undesired frequency, press CTRL+L

to add that frequency to the active Reject List.

Reject must be enabled for the program to skip over locked out frequencies in
Scan or Search modes. The Reject List may be viewed by pressing CTRL+V or selecting from Reject Menu. A highlighted frequency may be removed from the

list by pressing CTRL+C. When the list is not being viewed, Ctrl+C deletes the last frequency on the list. The list can be saved by pressing CTRL+S. You will be asked for a path/filename for the list.

AutoReject is easily used in a hands-off, automated mode controlled by the Script function. The syntax for AutoReject in a Script is as follows:

REJECT {ON|OFF|ADD|CLEAR|ERASE|LOAD [filename]|SAVE [filename]}

If a filename is not specified for the LOAD or SAVE versions of the command,

then the reject function will ask for it.

Example Script Commands:

```
REJECT ON / turns ON AutoReject
REJECT OFF / turns OFF AutoReject
REJECT ADD / add current freq to Reject List
REJECT CLEAR / clear last item from list
REJECT ERASE / erase entire list
REJECT LOAD birdlist.rej / load Reject List from file
REJECT SAVE newbirds.rej / save Reject List to a file
```

AutoReject Limitations
==========

The maximum Reject List size loaded from file is 32,511 entries. Hint: After
starting load, press F7 once, the reject menu will pop up when the loading is
finished. The program will not respond to any keys while loading is underway,
however, they are stored in the keyboard buffer and will execute when loading
is finished. The program performs no updates while loading the Reject File,

therefore, the display does not change (blinking continues though) even though
the scanner continues to do it's thing.

The Reject List must be an ASCII text file with one frequency per line. The

actual file size in bytes is not important, but the number of lines (entries) is.
Attempting to load a file with too many entries will crash the program (subscript
out of range error). The maximum number of entries that can be entered while on
line is 128 more than the 32,511 entry file limit. When loading the file, the
program throws in additional space for 128 entries. If running a Script that uses
the AutoReject function such as our old "LogNlok.SCR", the program will crash when
this limit is exceeded.

SUMMARY AND CONCLUSION
==========

The CE-232's AutoReject helps the scanner Search and find new and interesting
frequencies by giving the operator full control over which signals are to be
excluded from being found, AutoLogged, and saved. You can have as many

*.REJ
files as you want, and each file can hold as many as 32,511 frequencies. Chances are, you'll never need that many, but a typical *.REJ file will start
with the nearly 100 birdies that are resident in the PRO-2004, PRO-2005, and PRO-2006. 500 or so reject frequencies would be a rather large list.

The CE-232 comes with a Script called BIRDFIND.SCR that, with only a little operator startup assistance, finds and AutoLogs all birdies in the scanner.

It is then a simple matter to edit the *.LOG file to remove everything but the
frequency column and resave it in the \REJ subdirectory as a *.REJ file. You
can then add to it, as described above, all the worthless pager, tone, and data
frequencies that are encountered in your Searches. The AutoReject function alone
can make scanning much more productive and less of a drudgery than ever.

A TUTORIAL ON
THE CE-232 SCANNER/COMPUTER INTERFACE'S
ENHANCED USER FEATURES & FACILITIES

INTRODUCTION
============

The CE-232 Scanner/Computer Interface is a 2.5" x 3" electronic board that goes between an IBM-PC/compatible computer and a VHF-UHF scanning receiver for a host of powerful capabilities.

The CE-232 is a -smart- RS-232 Interface controller and data acquisition system for some scanners and at least a drudgery-free automatic programmer and remote controller for all supported scanners.

The CE-232 eliminates a lot of the drudgery and labor in scanning by its ability to "AutoProgram" up to 999 memory channels from a plain ASCII text file in a short time, error-free and exactly the way you want the scanner configured.

The CE-232 also allows REMOTE control of the scanner from the computer keyboard; a strong +plus+ for handheld scanners and those with hard-to- operate keyboards like the PRO-43, PRO-2035 and PRO-2042!

The CE-232 is a one-way controller and AutoProgrammer like described above for MANY scanners, including the PRO-2042, PRO-2035, PRO-2022, PRO-43, PRO-39, PRO-37, PRO-34, PRO-26, etc.

The CE-232 is a TWO-WAY controller, AutoProgrammer and data acquisition system for the time-honored PRO-2004, PRO-2005, and PRO-2006 scanners which have unique circuitry that allows the CE-232 to do MUCH more than just AutoProgram and Remote Control, including AutoLog data on "hits", AUTO-REJECT undesired signals, AUTO-LOOKUP data about a certain frequency, and much more.

The CE-232 also has a number of non-specific, user-definable features and facilities that can be used to greatly enhance the rewards of scanning, monitoring, and processing the data used in and acquired from radio activities.

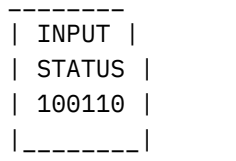
CE-232 USER FACILITIES OVERVIEW
==============================

The CE-232 offers some very powerful resources in addition to the more or less "standard" features of AutoProgramming, AutoLogging, AutoReject, AutoLookUp, Scripting, and Remote Keyboard Control.

These standard features are extremely powerful in their own right, but the CE-232 goes the extra mile with some non-standard features to keep scanner life interesting and right up there on the bleeding edge. These special features are "user" definable; that is, they don't do anything until the operator has a use for them and makes the necessary connections and motions to use them. These User Facilities include:

User Switches: a CMOS 74HC4066 Quad Bilateral Switch chip on the CE-232 board with accessible "contacts" at Points AA-DD. Otherwise referred to as SW1, SW2, SW3, and SW4, the function of these solid-state switches is identical to that of four individual SPST switches. The CE-232 User can apply these switches however he wants, from turning the BEEP on and off, to control of tape recorders, DTMF and CTCSS decoders, to.... limitless possibilities. The CE-232 software can also control these switches via automation.

Status Inputs: six ports on the CPU of the CE-232 are available to the User much like "idiot lights" in a car. These ports are seen as the INPUT STATUS on the main operating screen of the CE-232 program, and are useful for displaying binary information, 1's and 0's, just like six "lights" in a row, on or off.



The information to be displayed here is strictly up to the User and does not have to be used. These ports are on the CE-232 board as Points EE-JJ. The User can apply 0v and +5v signals to these ports for display on screen of the results and other uses as described later.

InBytes: eight more ports on the CPU of the CE-232 are available to the User in exactly the same fashion as the STATUS INPUTS described above with the sole difference that they are not displayed on the main operating screen. These eight INBYTE ports are on the CE-232 board as Points KK-RR.

OutBytes: eight ports on the CPU of the CE-232 are available to the User as output signals or controls. Vaguely

similar to the User Switches described above, the
OUTBYTES are logic level ports with 0v (low) and +5v
(high) available to control user-defined external
devices or circuits that can work with CMOS logic.
See ahead for a more detailed description. The
OUTBYTES are available on the CE-232 board as Points
SS-ZZ.

Program Screens: If you run the CE-232 with its supplied control
program, there are four viewing screens, selectable
with the right/left cursor keys and/or the <F10>
pulldown menu:

```
+---------------------------------+
| *** Page Selection Menu *** |
| Keypad display |
| Status display |
| script Msg display |
| Lookup display |
+---------------------------------+
```

These screens are self-evident and little else needs
said about them in this section.

CE-232 USER FACILITIES DETAILS
==========

USER SWITCHES

A 74HC4066 CMOS Quad Bilateral Switch (IC-7)controlled by the CPU on
the CE-232 board is dedicated to User definable applications. The four
bilateral (either way) switches are SPST and completely independent
from each other. Points AA-DD on the CE-232 board are the switch
"contacts" for SW-1, SW2, SW3, and SW4, respectively. Status of these
switches (open = 0, closed = 1) is indicated on the main screen.

The User Switches are controllable by any of three means:

1. Keyboard control from the PC: CTRL+F1 through CTRL+F4 for
SW1-SW4, respectively.

```
AA BB CC DD
o o o o
| | | | This diagram is
| | | | symbolic of the
SW1 \ SW2 \ SW3 \ SW4 \ four User Switches.
\ \ \ \ The "contacts" are
| | | | non-polarized. The
| | | | switches are SPST.
o o o o
AA BB CC DD
```

2. <F2 - Misc> Pulldown Menu Control from the PC keyboard:

```
+-----------------------+
| *** Misc Menu *** |
| SW1 ..Ctrl+F1 |
| SW2 ..Ctrl+F2 |
| SW3 ..Ctrl+F3 |
| SW4 ..Ctrl+F4 |
| Quit |
+-----------------------+
```

3. Program (automated) control via a Script using either of two commands:

OUTSW = NNNN where N = 0|1|X
0 = off
1 = on
X = don't care/leave as is

SWx = ON|OFF where (x) is a number, 1-4.

Please see the Script Tutorial for details of these two Script commands that control the User Switches.

The User Switches are true bilateral switches in the sense that the "contacts" of each switch are non-polarized, and can pass either DC or AC or both. Unlike electromechanical switches, CMOS switches are solid-state and have certain limitations. See CAVEAT next.

CAVEAT: CMOS switches have their limitations: maximum current that can be passed through a single switch is about 25-mA, and the maximum applied voltage to either contact is roughly 10% more than the Vcc (power supply voltage), or in this case, 5.5 volts. The 4066 chip will definitely destruct if you apply signals that exceed these limits. This may seem a serious limitation, but it isn't. A User Switch can be used to bias the base of a transistor switch to turn it on and off. If the transistor can't handle the load, then it can control a relay to do the heavy duty switching. Following is a graphic example:

```
+5v +--|<----> +8v
^ | LED
| 5 volt | +----------->
| Relay C |
| Coil C o Relay
AA o CE-232 C - - - - \ Contacts
\ User | o \ for heavy
AA o \ Switch | | duty switching
| SW1 / |
| 10k |/ NPN +----------->
+----------/\/\/\-------|\ Transistor
| \ 2N2222A, etc
|
|
Gnd
```

The above example of how a CE-232 User Switch can be used for heavy duty switching needs is not designed for consumption as shown - it certainly needs a few refinements like a suppressor diode across the coil of the relay, and the 10-k resistor might need to be "tweaked" for a more desirable value. But you get the idea now......

SUMMARY AND CONCLUSION OF THE CE-232 USER SWITCHES
==

Four low power SPST CMOS switches are provided on the CE-232 board with contacts at Points AA-DD for the User to do with as he sees fit. The status or states of the User Switches are Autologgable.

These switches can be manually controlled by the operator from the PC keyboard or by automated means from a Script. The User Switches are capable of directly controlling CMOS and other low power circuits including Extended Memory modifications, DTMF and CTCSS decoders; and a host of other possibilities.

Where higher current is needed, like for tape recorders, etc, a simple transistor switch can be controlled by a User Switch for the same effect or result. The User Switches are for the User's purposes and are not limited to any particular role or function.

STATUS INPUTS OR INPUT STATUS

The INPUT STATUS registers are among the least understood and utilized features of the CE-232, probably because we have not touted or pushed them to any serious extent. For that, we apologize, because the Status Inputs are a very powerful feature, indeed!

Say you're driving along the highway and your car's oil or temperature light comes on? If you see it in time, you might avert disaster.

Well, the INPUT STATUS registers are a little like "idiot lights" in your car. They come ON and go OFF. You can make them come ON and OFF. All it takes for OFF is no signal at all; i.e. a logic low or 0-volts. ON requires something over +3 volts, and not over +5.5 volts. Any voltage in this range will make a Status Input bit go from 0 to 1. There are 6 Status Input bits for you to allocate at your discretion.

The six Status Input bits are physically located on the CE-232 board as Points EE, FF, GG, HH, II, and JJ. And they are displayed on the main operating screen by the CE-232 program as six binary bits:

```
________ 100110
| INPUT | The location and ^^^^^^
| STATUS | significance of each ||||||
| 100110 | bit can be determined JJ-+|||||
|________| by the figure to the HH--+||||
right. The actual GG---+|||
display is similar to FF----+||
that shown on the left. EE-----+|
```

II------+

Here is an example use of a Status Input bit. See the left-most bit? That comes from the status at Point JJ on the CE-232 board. Now suppose we connected a Squelch signal to Point JJ, where the voltage was 0-volts when Squelch is set and about 5 volts when Squelch breaks?

If we can do that, then whenever you see a "0" in the first bit, the scanner's Squelch is set (no signals coming in). When that bit shows as a "1", then a signal is coming in to break the Squelch. No problem if your Volume is turned up, but what if it's down? Then you can still tell when a signal comes in, see?

It's easy. Let's take the PRO-2006 for example. If you solder a wire to Pin 1 of IC-3 (+5v Squelch signal) and the other end of the wire to Point JJ on the CE-232 board, presto! There's your Squelch Indicator!

The INPUT STATUS bits are not related to each other. That is, what ever goes on with one bit does not affect the other five. Therefore, each of the six bits can serve different purposes, just like a row of "idiot lights". Or....you can combine two or more to a source of binary signals for a combinational display.....say an S-METER, for instance!

Take my LED S-Meter modification featured in Vol-2 of my SCANNER MODIFICTION HANDBOOK, as an example. Up to ten LED's light up to offer eleven total levels of signal strength: 0 through 10. A slight adaptation of the LED S-Meter circuit makes a great source of signal for the CE-232's STATUS INPUT registers. Suppose we used the right four STATUS bits....(The left most one is for Squelch, remember.)

Okay, like I said, my LED S-METER circuit can be slightly modified to produce its eleven indications in BINARY form like this:

BINARY S-METER STATUS INPUT
OUTPUTS DISPLAY
0 = 0 0 0 0 0 = 100000
1 = 0 0 0 1 1 = 100001
2 = 0 0 1 0 2 = 100010
3 = 0 0 1 1 3 = 100011
4 = 0 1 0 0 4 = 100100
5 = 0 1 0 1 5 = 100101
6 = 0 1 1 0 6 = 100110
7 = 0 1 1 1 7 = 100111
8 = 1 0 0 0 8 = 101000
9 = 1 0 0 1 9 = 101001
10 = 1 0 1 0 10 = 101010

So when the modified LED S-Meter mod's four binary outputs are connected to the STATUS INPUTS at Points GG, FF, EE, and II, then we instantly have a visible S-Meter in the CE-232's Display and also an S-Meter signal that can be logged with other important data by the AutoLogger! Remember, we tied the Squelch to the left bit (JJ) and

haven't allocated anything to the one right of it (HH). It can still be used for something else.

One of the hottest and most powerful aspects of the STATUS INPUTS is that they're AutoLoggable! If you have an S-Meter hooked up as described above, then you can choose Extended AutoLogging to acquire and store that data, as well. Signal strength is a very potent parameter of signal identification and analysis. In many areas, frequencies are shared among a variety of users, so strength is a strong tool for identifying who's who and what's where. Following are a few lines of a recent AutoLog file that shows S-meter readings:

```
START DURATION
BANK FREQ MODE STEP DATE TIME OF SIGNL S-METER
, 2, 862.5250,nfm, , ,SrUp,12.5,970921,123646,000008, 0000,100011, 3
, 2, 856.0500,nfm, , ,SrUp,12.5,970921,124728,000004, 0000,101010,10
, 2, 856.6000,nfm, , ,SrUp,12.5,970921,124739,000010, 0000,101010,10
, 2, 856.8250,nfm, , ,SrUp,12.5,970921,124754,000005, 0000,101000, 8
, 2, 857.3875,nfm, , ,SrUp,12.5,970921,124804,000009, 0000,100101, 5
, 2, 857.4625,nfm, , ,SrUp,12.5,970921,124814,000004, 0000,100010, 2
, 2, 857.5250,nfm, , ,SrUp,12.5,970921,124819,000023, 0000,100001, 1
, 2, 857.7375,nfm, , ,SrUp,12.5,970921,124843,000007, 0000,101000, 8
, 2, 857.7750,nfm, , ,SrUp,12.5,970921,124851,000021, 0000,101000, 8
, 2, 857.7875,nfm, , ,SrUp,12.5,970921,124913,000008, 0000,100111, 7
```

I added the decimal equivalent of the binary S-meter readins to the far right column just to make it easier for you to see how signal strengths can be important in computerized monitoring. Suppose, for instance, that I was a DX hunter. Well, I could write a Script or adjust my database to disregard signal strengths greater than "5", thereby affording me the luxury of not having to sort through a bunch of strong local signals.

SUMMARY AND CONCLUSION OF THE STATUS INPUT BITS
==========

The Status Inputs are undefined, unallocated input ports for the User to do with as he pleases (within reason). These inputs require 0v and +5v logic with 0 being 0v +/-0.5v and 5v being +5v +/-0.5v, except that high indications (1) may display with as little as +3.5v. Anything more than about +5.5v is likely to destroy the CE-232's CPU so caution is advised.

These ports will sink 1.0 to 2.5-mA so take that into accout when picking the logic signals to be displayed/logged. If you know Ohm's Law, you can use this information to calculate a dropping resistor so that other voltages can be plugged into the Status Inputs. For example, say you wanted to display an 8-volt status. Well, you'd need a resistor to drop 3 volts leaving 5 volts to the Status bit. Ohms Law says R = E/I, so we calculate: 3v/.0025 = 1200 ohms. But let's calculate for the lower current range, too: R = 3v/.001 = 3000 ohms. Therefore, start with a 4700-ohm resistor in series between the 8v

source and the Status Input bit. Be sure to measure the voltage at the Status bit point to ensure less than +5.5v, and preferably a trifle under +5.0v.

The INPUT STATUS bits will indicate whatever you want them to, and the results are AutoLoggable for great power in signal and results analysis. Now do you see the light? If so, read on, because it gets better. If not, read on anyway, because the next discussion might bring it all together for you.

INBYTES

There are eight INBYTE registers that do exactly the same thing as described above for the INPUT STATUS bits. There is no difference between them other than the STATUS INPUTS are displayed on the main program screen while the INBYTES are not. THAT is the ONLY difference.

Therefore, if the six STATUS INPUT bits aren't enough for your needs, relax....eight more exist as the INBYTE bits.

The INBYTES are AutoLoggable, and may be viewed from the Status Screen of the CE-232 program. It appears something like this:

==========

-CE-232 SCANNER INTERFACE PROGRAM-

Search Monitor 1 2 3 4 5 6 7 8 9 10

on on on
```

==========

So, with a little getting used to the several CE-232 viewing screens, you can view your Extended data, even if the AutoLogger isn't on at the time. It's really a no-brainer, even if the above screen doesn't make any sense at the moment.

The INBYTES are available to the user as Points KK, LL, MM, NN, OO, PP, QQ, and RR on the CE-232 board.

OUTBYTES

I said above somewhere that the OUTBYTES were similar to the User Switches. That isn't really "right" except that in some applications, you really can't tell the difference. But first and foremost, the User Switches really are switches.

The OUTBYTES, however, are logic level outputs of 0v and +5v, controllable from the Script function. In the case of my Extended Memory mods of 1600, 3200, 6400 and 25600 channels that require Address Block switching using 0v and +5v, it doesn't matter whether you use a switch or logic signals for control. In my books, I called for toggle or DIP switches to control the memory Blocks by applying low and high logic as needed to switch the Blocks.

The OUTBYTES can do that, too. Whereas the User Switches have several methods of control, one from the PC keyboard, the OUTBYTES can be controlled only from within a running Script, so see the Script Tutorial for exactly how to make them work for you. In a word, the OUTBYTE Script command is:

```
OUTBYTE = nnnnnnnn
^^^^^^^^
||||||||
|||||||\---<Bit 0
||||||\----<Bit 1
|||||\-----<Bit 2
||||\------<Bit 3
|||\-------<Bit 4
||\--------<Bit 5
|\---------<Bit 6
\----------<Bit 7
```

where n = 0, 1, or X and
0 means off or low
1 means on or high
X means don't change it (leaves the bit set unchanged)

Example: Say the current state of the OUTBYTE is: 00110011
and you want to change it to 11001100, then the Script
command should be:

```
OUTBYTE = 11001100
```

However, suppose you don't care about bits 0,3,and 7,
then:

```
OUTBYTE = 1X001X0X
```

The OUTBYTES can source a couple of milliamps, if pressed to do so, but you should remember that these are not power supplies and should not be tasked with powering anything. The OUTBYTES are logic gates controlled by the CE-232's CPU and you don't want to risk blowing it up. At $35 or so a pop, CPU's are expensive. Use the OUTBYTES as control signals all you want, but if you're smart, make them feed high impedance loads, at least 5000 ohms or greater, preferably greater. Under no circumstances, even for a moment, let the OUTBYTES feed impedances lower than 4000 ohms. 10-k and up is preferred.

There is another slick application for the OUTBYTES since they can be controlled by a Script and since Scripts can be used to make logical, intelligent decisions. MEMORY! Sure, why not? A Script can "read" or test for OUTBYTE settings as well as change them, so therein is a wonderful source of 8-bits of memory or 256 possibilities. A running Script using IF - THEN - ELSE logic could temporarily store numbers or codes into the OUTBYTES and then retrieve or change them later, or make other decisions based on the contents. One example that comes to mind is as a COUNTER for how many times a given frequency is active. There are many possibilities, limited only by the imagination. I'll leave it to your ingenuity to find other uses for the OUTBYTES.

CE-232 USER FACILITIES SUMMARY & CONCLUSION
==========

The four User Switches, eight OUTBYTES, eight INBYTES and six STATUS INPUTS offer the CE-232 User an immense array of generic tools and resources by which to automate, simplify, and expand on the arts and sciences of radio monitoring. In a sense, these "extras" offer the User a variety of ways to attach external and unrelated devices to the CE-232 and the scanner for unattended operation and control. Anything that outputs a digital code.....from DTMF and CTCSS decoders to pager decoders to other esoteric devices.....can be controlled by or accept input to the CE-232 User Facilities.

Four bits of the OUTBYTES can control the 16 Block 6400 channel Extended Memory mods; six bits of the OUTBYTES can control the 64 Block 25600 channel Extended Memory mod. Five bits of the OUTBYTE can control the Communications Specialists' TS-32P CTCSS Decoder. The INBYTES and STATUS INPUTS can accept inputs from these devices and much more. A Script can be written to decode the binary data and make decisions accordingly.

Possibilities are absolutely endless, limited only by the User's imagination and experience in electronic hacking.

On the other hand, even the greenest neophyte can benefit from the CE-232's standard features and never employ the enhanced User Facilities. They are simply there for use as desired....or not, and in no way do they get in the way of the powerful basic/standard functions. The CE-232 enhanced User Facilities just add to the power of scanning if and when the User has an "idea".....

A TUTORIAL ON
THE CE-232 SCANNER/COMPUTER INTERFACE'S
SCRIPT FEATURE AND LANGUAGE SUMMARY

INTRODUCTION
============
The CE-232 Scanner/Computer Interface is a 2.5" x 3" electronic board that goes between an IBM-PC/compatible computer and a VHF-UHF scanning receiver for a host of powerful capabilities.

The CE-232 is a -smart- RS-232 Interface controller and data acquisition system for some scanners and at least a drudgery-free automatic programmer and remote controller for all supported scanners.

The CE-232 eliminates a lot of the drudgery and labor in scanning by its ability to "AutoProgram" up to 999 memory channels from a plain ASCII text file in a short time, error-free and exactly the way you want the scanner configured.

The CE-232 also allows REMOTE control of the scanner from the computer keyboard; a strong +plus+ for handheld scanners and those with hard-to- operate keyboards like the PRO-43, PRO-2035 and PRO-2042!

The CE-232 is a one-way controller and AutoProgrammer like described above for MANY scanners, including the PRO-2042, PRO-2035, PRO-2022, PRO-43, PRO-39, PRO-37, PRO-34, PRO-26, etc.

The CE-232 is a TWO-WAY controller, AutoProgrammer and data acquisition system for the time-honored PRO-2004, PRO-2005, and PRO-2006 scanners which have unique circuitry that allows the CE-232 to do MUCH more than just AutoProgram and Remote Control, including AutoLog data on "hits", AUTO-REJECT undesired signals, AUTO-LOOKUP data about a certain frequency, AUTOMATED operations via a powerful Script function and much more.

OVERVIEW OF THE SCRIPT FUNCTION
==============================

The CE-232 Script Feature and Language provide a means of automating a huge array of scanner operations and program functions. A script essentially automates FOR you what you would do by hand if you were

operating the scanner. But it can also do things that you wouldn't think of in a moment of crisis or fumbling around for notes, tapes, recorders, etc. The things that you would do are logical in nature, and dependent on a number of variables. A Script can take those variables into account and make same kinds of decisions and actions that you would do (error-free and much faster!) Where you might fumble or panic, the Script will just do its thing.....

With a Script, you may at a specific time automatically reprogram the memory channels, turn on and off the AutoLogger, switch from Search to Scan, turn on and off a tape recorder, and perform a multitude of other tasks, all the while you sleep, play, or work. Also, various utilities can be developed to perform routine tasks, as controlled by the CE-232 and its software!

A Script is developed (written) with a SIMPLE text editor like NOTEPAD or WORDPAD in Windows or EDIT.EXE in MS-DOS, to produce a plain ASCII text file. Word processors have format and font codes that will cause problems for the CE-232 Script Processor. If you prefer to use a word processor, be sure to save the file as a plain *.TXT file, except instead of TXT, use the SCR extension to indicate a Script:

e.g. BIRDFIND.SCR

One of our favorite text editors for Script writing is QEDIT, a low cost, but very powerful shareware editor from Semware Corporation. But frankly, you can use anything that results in a plain ASCII text file. Windows' NOTEPAD is perfect for scripts. Here is an example of a very simple Script. I suppose you could write it with EDLIN.

```
============================
/ chandump.scr
keyclr
msg1- *** Turn squelch all the way down and press G to start
idle until key = g
chan = 1
manual
do
autolog on
idle until count = 7
autolog off
idle
manual
loop until chan = 1
idle until key = h
end
=========================
```

We call this one the CHANNEL DUMP SCRIPT. It steps through the memory channels, one at a time, and uses the AutoLogger to make a file of the contents of each channel.

Don't worry if you don't understand it yet - the purpose of showing it now is to convey the simplicity of the mechanics of writing a powerful Script. It's just a few lines of text saved as a <NAME.SCR> and that's all there is to it. Check it out again......

NOTE: The Script feature of the CE-232 is expressly for the PRO-2004, PRO-2005, and PRO-2006 scanners. Depending on how a Script is written, it may or may not work with other scanners. For instance, the AUTOPROGRAM command in a Script will work fine with all supported scanners, whereas the AUTOLOG command works only with the PRO-2004/5/6 series. In general, if data has to first come FROM the scanner to meet a Script requirement, then it will work ONLY with the PRO-2004/5/6.

If no data is required from the scanner, then chances are the Script will work with any supported scanner. The PRO-2004/5/6 scanners are unique in that they can SEND data to the CE-232 as well as receive commands and control from the CE-232. Other scanners can only be commanded and controlled (AutoProgrammed) by the CE-232 (still not bad.)

SCRIPT FEATURE DETAILS
======================

A Script consists of one or more COMMANDS arranged in a logical sequence, modified by any necessary parameters or variables. There are about 40 valid Script COMMANDS and a limited number of parameters and variables. In other words, it's not difficult to learn Scripting for the CE-232.

SCRIPT COMMANDS

Each command (with its parameters) must be on a separate line. The different parts (parameters) of each command must be separated with spaces or tabs. Command syntax is described using the following conventions and symbology:

COMMAND parameter [optional parameter] {choice1|choice2}

COMMAND: Upper-case indicates a word that is the command or part of command and must be correctly spelled.

parameter: Lower case letters are used to indicate parameters. It is required unless enclosed in brackets.

[optional parameters]: Brackets indicate optional parameters or command words.

{choice1|choice2}: Braces {} indicate choices (either/or, not both). A choice is required unless it is enclosed in brackets ie: [{xx|xx}] The pipe "|" means "or" and separates the choices.

Example: AUTOLOG [{ON|OFF}]

This example says that AUTOLOG can be used by itself, and when so, it toggles the current condition. If desired, the command word ON or OFF

may be used with it. The pipe symbol "|" always means "or" in computing. Remember that. So [{ON|OFF}] means "on -or- off". Not both! You would pick one or the other....or, neither, since the brackets [] indicate the parameters are optional. The AUTOLOG command all by itself would turn it OFF if it was on, and ON, if it was off. "Toggle" means change or switch states.

LABELS

Labels are used to identify (or mark) specific locations within a Script. When a Script is first started the program searches the file for labels and builds a table of their locations. A large Script will have a noticeable delay before starting while this is being done. A maximum of 32 labels are allowed. Labels are essential for the GOTO and GOSUB commands.

The label must be on a line by itself and consist of a colon ":", a space, and an alphameric or numeric name.

Example: : labelname
^
a single space must go here---^

COMMENTS

Comments (remarks) may be used within a Script as notes to the user and are ignored and skipped by the program when they start with a forward slash (/). The slash should be separated from the text of the comment with at least one space.

PARAMETERS

Most parameters will be described with their associated command further below, however, two common parameters (filename and condition) are explained now since they are used with a variety of commands.

filename - This parameter can be just a filename in 8.3 format or a complete DOS path.

condition - This parameter defines a condition to test and consists of three parts (item, operator, and value). Commands using this parameter must make a decision about some condition. The condition parameter uses the form "item - operator - value". Valid entries are:

```
=========================================================
ITEM OPERATOR below VALUE and format
======= ========= ========================
\|/
VALUE@x | x is a number, 0-9 (e.g, 4)
|
DATE | YYMMDD (eg: 970920)
|
TIME | HHMMSS (eg: 141000)
```

```
|
FREQ | freq# (eg: 144.0125)
|
CHAN | channel# (eg: 215)
|
SQBREAK | Yes or No (eg: YES)
|
INSW | Binary 6 bit value; 1,0,X
| (eg: 100X1) -(where X = don't care)
|
INBYTE | Binary 8 bit values; 1,0,X
| (eg: 111XX001) -(where X = don't care)
|
COUNT | number (eg: 6 )
| -(used only with IDLE command)
|
KEY | keyboard character or the word
| PRESSED which means any
| key has been pressed.
| -(case insensitive)-
|
| ----------------------------
| NOTE:
| A variable (VALUE@0 - VALUE@9)
| may be used for a value.
\|/
|
OPERATORS
_________________________________
= (equal to)
<> (not equal to)
<= (less than or equal to)
>= (greater than or equal to)
< (less than)
> (greater than)

Note the six OPERATORS. An OPERATOR goes between an ITEM and a VALUE:

e.g. CHAN <= 220 or FREQ > 220.0000 or TIME = 120030 etc.

=========================================================================
SCRIPT COMMANDS - Detail description and usage summary
=========================================================================

1 AUTOLOG [=] [{ON|OFF}]

Turns AutoLogger on or off. If ON or OFF are not specified then
the AutoLogger is toggled to the opposite state.

Examples: AUTOLOG = ON
AUTOLOG OFF
AUTOLOG
```

2 AUTOPROGRAM [FILTER [=] x] [OPTION [=] y] filename

Allows a Script to program the scanner from a file. Parameter x
above is the FILTER to use (up to 12 alphanumeric characters) and
y is the AutoProgram OPTION (A,B,C,or D). Any data not supplied
on the command line will be asked for by the AutoProgram function.

Examples: AUTOPROGRAM FILTER = feds OPTION = C fedfreqs.apf
AUTOPROGRAM fedfreqs.apf
AUTOPROGRAM

NOTE: FILTER is the first field of an AutoProgrammer (*.APF)
file (the field to the left of the first comma). Filters are a way
of dividing a large frequency file into logical smaller groupings.
For instance, say your frequency file had 1200 entries. You might
want to divide them up into three 400-channel groups. You could
use FEDS as the first filter; BUSN as the second filter; and AERO
for the third filter.

NOTE: OPTION is the one of four choices from the <F4> AutoProgram
pulldown menu on how to AutoProgram the scanner at that moment:

```
+-----------------------------------------------+
| *** AutoProgram Menu *** |
| Program scanner from file ..... F4 |
| ..Option A - use file's chan numbers..... |
| ..Option B - ignore file's chan numbers..... |
| ->Option C - filter file & use chan numbers... |
| ..Option D - filter file & ignore chan numbers |
+-----------------------------------------------+
```

3 CHAN [=] {y|VALUE@x} -(where x is a number from 0 to 9)-

This command switches to program mode and calls up the specified
channel. The scanner is left in program mode after command is
complete. The parameter y is the channel number desired.

Examples: CHAN = 205
CHAN 12
CHAN = VALUE@4 (variable - see VALUE@x command)

4 CHAIN filename

This command terminates the Script and starts another Script. If
the filename does not contain a path specification then the Script
path from the path setup is searched for the file.

Examples: CHAIN newscrpt.scr
CHAIN c:\ce-232\scr\newscrpt.scr

5 CLEAR (alternate is CLR)

This command presses the scanner CLEAR key; no parameters for
this command.

6 DELAY [=] [{ON|OFF}]

Turns scanner's delay function on or off. If ON or OFF is not specified then the current state is toggled to the opposite state.

Examples: DELAY ON
DELAY

7 DIRECT

Pushes the scanner's DIRECT key. There are no parameters associated with this command.

8 DO
LOOP [UNTIL condition]

This command allows controlled loops within the Script. The Script statements following the DO are executed until the LOOP word is reached. If there is a condition parameter following an UNTIL word, the condition is evaluated. If the condition is true then the Script moves on to the next statement. If the condition is false or if there is no condition to test (LOOP by itself) then the Script returns to the DO line and runs through the loop again. When a DO LOOP is encountered the return location is pushed on to a stack. The size of the stack allows nesting DO LOOPs 32 levels deep. The GOSUB command uses the same return stack and is a part of the 32 level limitation if contained within the nested loops. Labels use a separate table of locations and do not affect the return stack.

Example: DO
:
:
(block of Script code goes here)
:
:
LOOP UNTIL CHAN = 400

9 END

This command terminates the Script. There are no parameters associated with this command. An END is not required at the end of the Script but this command allows the Script to be terminated within the Script based upon some event.

10 ENTER

Pushes the scanner's enter key. No parameters are associated with this key.

11 FREQ [=] {y|VALUE@x} -(where x is a number from 0 to 9)-

This command switches to program mode and enters specified frequency. Scanner is left in program mode after command is complete. The parameter x is the frequency desired.

Examples: FREQ = 169.75
FREQ 89.5
FREQ = VALUE@3 (variable - see VALUE@x command)

12 GOTO label

The Script will jump to the location specified by the labelname
and continue with the next statement following the label.

13 GOSUB label
RETURN

Subroutines can be used in a Script. This command functions
identical to the GOTO command except that the Script will return
to the line following the GOSUB statement when the RETURN command
word is encountered. This command uses the same return stack as
the DO LOOP. See the DO . LOOP command for a discussion of the
return stack.

Example: GOSUB labelname
....next block of Script (whatever...)
: labelname (remember the space after the colon!)
....block of Script code
RETURN

14 IDLE [UNTIL condition]

This command suspends Script processing until some condition is
met. IDLE by itself (ie; with no other parameters) will suspend
the Script for one update cycle. If a Script turns the AutoLogger
on then back off, an idle command using a condition of COUNT = 6
is required since squelch break must be present for at least 5
update cycles before it will consider the signal valid.

NOTE: The COUNT item should only be used with the IDLE command.
COUNT represents a desired number of update cycles. Using it with
other commands requiring a condition parameter will have
unpredictable and probably peculiar results.

Examples: IDLE UNTIL KEY = PRESSED
IDLE UNTIL COUNT = 6
IDLE UNTIL KEY = G
IDLE UNTIL TIME = 163000

15 IF condition [THEN] (IF....THEN....ELSE....ENDIF)

These commands allow for logical decision structures.

IF some condition is true THEN a block of commands will be run
ELSE another block of commands will be run. Since a return
location is not required, there is no limit on nesting IFTHEN's
within IFTHEN's.

Examples: IF condition [THEN]
.... block of Script code

```
[ELSE]
.... optional block of Script code if else is used.
ENDIF
```

16 INPUT@x [prompt message] -(where x is a number from 0 to 9)-

This command prompts the user for an input by popping up a dialog box. A prompt message will be displayed if provided. The entered data is stored in the corresponding variable (VALUE@0 thru VALUE@9). See the VALUE@x command for a discussion of variables.

```
Examples: INPUT@0 Enter starting channel
INPUT@1 Now enter the ending channel
INPUT@7
```

17 KEYCLR

Clears the last key buffer. When a key is pressed, it remains in a last key buffer until another key press replaces it or it is cleared with this command. It is wise to start Scripts with this command to ensure no extraneous keypresses are lurking.

```
Example: DO
KEYCLR / clears last key otherwise
IDLE UNTIL KEY = PRESSED / the Script will continue
IF KEY = G THEN / cycling through the loop
.... block of Script code / based on the last key
ENDIF / pressed.
IF KEY = U THEN
.... block of Script code
ENDIF
LOOP UNTIL KEY = J
```

18 LIMIT

Pushes the scanner's limit key. No parameters are associated with this command.

19 LOCK-OUT [=] [{ON|OFF}] (alternate spelling: LOCKOUT)

Turns scanner's lockout function on or off. Without parameters it toggles the lock-out state to the opposite state.

```
Examples: LOCK-OUT = ON
LOCKOUT OFF
LOCK-OUT
```

20 MANUAL (alternate word: MAN)

Presses the scanner's manual key. No parameters are associated with this command.

21 MODE [=] [{nfm|wfm|am|VALUE@x}] -(where x is a number from 0 to 9)-

Selects specified receive mode. Without parameters this command
cycles to the next receive mode (pushes scanner's mode key).

Examples: MODE = nfm
MODE am
MODE = VALUE@7 (variable - see VALUE@x command)
MODE

Note: MODE values are case-sensitive (use lower case only!)

22 MONITOR

Presses the scanner's monitor key. No parameters are associated
with this command.

23 MSGx- Script message to display
-(where x is a line number from 1 to 9)-

This command allows the Script to display a message of up to 80
characters on the line 1 thru 9 of the Script Msg Screen (replace
x with line number). MSGx- without a message following it will
clear the screen. Any variables (VALUE@x) within the msg text
will be replaced by the value of the variable.

Examples: MSG1- This message would be displayed
MSG2- on the Script Msg Screen
MSG1- This message replaces the previous line 1 message.
MSG6- The frequency is VALUE@3 MHz.

24 OUTBYTE [=] {binary number|VALUE@x}
-(where x is a number from 0 to 9)-

Sends an eight bit value out the hardware outbyte port. An X in
the binary number will result in that bit position remaining in
the same state as previously sent.

Example: OUTBYTE 11X0X001
\-----> an 8 bit binary number.
1 = on 0 = off X = don't care

OUTBYTE = VALUE@9 (variable - see VALUE@x command)

NOTE: The eight OUTBYTE ports of the CE-232 are at Points SS-ZZ
on the CE-232 board. These ports are simply software controlled
logic level outputs of either 0-volts or +5 volts. The Script's
OUTBYTE command controls the voltage at these eight ports. For
example, the command OUTBYTE = 00000000 sets all eight ports to
0 volts (logic low). Conversely, OUTBYTE = 11111111 sets all 8
ports to +5v (logic high). OUTBYTE = 00000001 sets Port 0 to +5v
and Ports 1-7 to 0 volts. OUTBYTE = 10101010 sets even Ports 0-4
to 0 volts and odd Ports 1-7 to +5v. OUTBYTE = 1XXXXXXX doesn't
change the settings of Ports 0-6, but sets Port 7 to high (+5v).

Like the User Switches (OUTSW) described below, the OUTBYTEs can
be used to turn things on and off, but only at CMOS logic lovels.

The OUTBYTEs are not actually switches and they are not a power supply; they are logic level bits that are available for the User to apply for his own purposes, an example of which would be the address Blocks of Extended Memory Mods. The OUTBYTEs can also control transistor or solid state switches that CAN be used to switch heavier loads, including power supplies.

The OUTBYTEs have no keyboard control; they are operable solely through the Script command described above.

25 OUTSW [=] {binary number|VALUE@x} -(where x is a number from 0 to 9)-

Also see the SWx command below.

Opens and/or closes the CMOS User Switches (SW1 thru SW4) but allows one command to control all four switches at once. An X in any bit position(s) leaves that associated switch(es) in its existing state. The four User Switches are at Points AA-DD on the CE-232 board.

Example: OUTSW 11X0
\-----> a 4 bit binary number
1 = on 0 = off X = don't care
msb is sw4 lsb is sw1

OUTSW = VALUE@5 (variable - see VALUE@x command)

NOTE: The CE-232 has one unallocated 4066 CMOS Quad Bilateral IC switch for whatever purpose the Use might conceive. Basically, it's a bank of four SPST switches that can be controlled from the PC keyboard or by means of a Script command as shown above. Like any switch, the User Switches (OUTSW) can be used to turn things on and off. The primary intent is to offer the User a way to turn other modifications on and off. The User switches can be used, for example, to control the Blocks of an Extended Memory mod, or to turn a tape recorder on and off. Possibilities are endless!

26 PAUSE [=] [{seconds|VALUE@x}] -(where x is a number from 0 to 9)-

This commands simply pauses. All program activity stops for the specified number of seconds. If no parameters are used then a default value of one second is used. The seconds parameter must be whole seconds. Fractional seconds are not allowed.

Examples: PAUSE = 20
PAUSE 10
PAUSE = VALUE@8 (variable - see VALUE@x command)

27 PRIORITY [=] [{ON|OFF}] (alternate word: PRI)

Turns scanner's priority function on or off. Without parameters this command just presses the scanner's priority key.

Examples: PRIORITY = ON
PRIORITY OFF

28 PROGRAM (alternate word: PRGM)

Presses the scanner's program key. No parameters are associated
with this command.

29 REJECT {ON|OFF|ADD|CLEAR|ERASE|LOAD [filename]|SAVE [filename]}

Allows the Script to work with the Reject function. If a filename
is not specified for the LOAD or SAVE versions of the command,
then the reject function will ask for it.

Examples: REJECT ON
REJECT OFF
REJECT ADD / add current freq to Reject List
REJECT CLEAR / clear last item from list
REJECT ERASE / erase entire list
REJECT LOAD birdlist.rej / load Reject List from file
REJECT SAVE newbirds.rej / save Reject List to a file

30 RESET

Presses the scanner's reset key. No parameters are associated
with this command.

31 REVIEW

Presses the scanner's lock-out review key. No parameters are
associated with this command.

32 SCAN

Presses the scanner's scan key. No parameters are associated with
this command.

33 SEARCH [=] [{UP|DOWN}]

Selects the specified search mode. Without parameters the command
defaults to pressing the scanners's search up key.

Examples: SEARCH = UP
SEARCH DOWN
SEARCH

34 SHELL filename

The Script may launch another program with this command. The
CE-232 program remains in memory and resumes where it left off
when the external program is terminated.

Examples: SHELL myeditor.exe
SHELL c:\tools\database.exe

35 SPEED (alternate word: SPD)

Presses the scanner's speed key. No parameters are associated
with this command.

36 STEP [=] [{12.5|50|5|VALUE@x}] -(where x is a number from 0 to 9)-

Selects specified step size in Search mode. Without parameters
the scanner's step key is pressed.

Examples: STEP = 12.5
STEP = 50
STEP = 5
STEP

37 SWx [=] {ON|OFF} -(where x is a number from 1 to 4)-

Also see the OUTSW command above.

The User Switch specified by x is turned on or off. The ON or OFF
word must be used otherwise the command is ignored. This command
is related to the OUTSW command, except that it controls only the
specified User Switch (x). OUTSW can control all four with a
single command.

Examples: SW1 = ON
SW2 OFF

38 VALUE@x [=] {param1 | param1 {+|-} param2}
-(where x is a number from 0 to 9)-

Ten variables (VALUE@0 thru VALUE@9) are available for use in
Scripts. Addition and subtraction can be used with these
variables when the variable word appears as a command. In other
words, you can not do addition or subtraction of variables within
a condition parameter, only when VALUE@x appears on a line unto
itself (see examples below). The value of a variable can be
anything (number, text, etc.) but should be related to its
intended use. Trying to add a date to a frequency doesn't make
much sense. Parameters must be chosen from the following lists:

param1: FREQ (uses scanner's current frequency)
CHAN (uses scanner's current channel)
DATE (uses current date)
TIME (uses current time)
VALUE@x (uses value in VALUE@x)
number (uses specified number)
text (uses first word of specified text)

param2: VALUE@x (uses value in VALUE@x)
number (uses specified number)

Note: The INPUT@x command can accept a multiple word text entry.
That entry is stored in the appropriate VALUE@x variable. Using
that variable in a MSGx- command will result in the entire entry
being displayed. However, the VALUE@x command will not assign a
multiple word entry following it to a variable. This command will

transfer it to another variable (ie; VALUE@4 = VALUE@2). Also,
addition and subtraction on text values is meaningless.

Examples: VALUE@0 = 125.5
VALUE@9 = VALUE@0 - VALUE@6
VALUE@0 = FREQ + 2.5 (The value of the current frequency
plus 2.5 Mhz is stored in VALUE@0.)
VALUE@0 = VALUE@0 + 1 (The value in VALUE@0 is increased
by one.)
VALUE@8 = 125.355 (125.355 is stored in VALUE@8)

39 INDIVIDUAL KEY COMMANDS:

Specific single character scanner keys can be used from the Script
(ie; P for Program, M for Manual, T for Step, O for Mode, etc.)

==========

SCRIPT COMMAND SUMMARY - QUICK REFERENCE

Command Name Syntax & Form
============ =============
AUTOLOG AUTOLOG [=] [{ON|OFF}]
AUTOPROGRAM AUTOPROGRAM [FILTER [=] x] [OPTION [=] y] filename
CHAN CHAN [=] {y|VALUE@x} (x is 0 to 9)
CHAIN CHAIN filename
CLEAR CLEAR (alternate form CLR)
DELAY DELAY [=] [{ON|OFF}]
DIRECT DIRECT
DO DO
LOOP LOOP [UNTIL condition]
END END
ENTER ENTER
FREQ FREQ [=] {y|VALUE@x} (x is 0 to 9)
GOTO GOTO label
GOSUB GOSUB label
RETURN RETURN (from subroutine)
IDLE IDLE [UNTIL condition]
IF [THEN] IF condition [THEN]
.... block of Script code (do something)
ELSE [ELSE]
.... optional Script code if ELSE is used (do something).
ENDIF ENDIF
INPUT@x INPUT@x [prompt message] (where x is 0 to 9)
KEYCLR KEYCLR
LIMIT LIMIT
LOCK-OUT LOCK-OUT [=] [{ON|OFF}] (alternate spelling: LOCKOUT)
MANUAL MANUAL (alternate word: MAN)
MODE MODE [=] [{nfm|wfm|am|VALUE@x}] (x is num 0-9)
MONITOR MONITOR
MSGx- MSGx- Script message to display -(x is line number 1 to 9)
OUTBYTE OUTBYTE [=] {binary number|VALUE@x} (x is 0 to 9)

OUTSW OUTSW [=] {binary number|VALUE@x} (x is 0 to 9)
PAUSE PAUSE [=] [{seconds|VALUE@x}] (where x is 0 to 9)
PRIORITY PRIORITY [=] [{ON|OFF}] (alternate word: PRI)
PROGRAM PROGRAM (alternate word: PRGM)
REJECT REJECT {ON|OFF|ADD|CLEAR|ERASE|LOAD [filename]|SAVE
[filename]}
RESET RESET

=====================================================================
A FUNCTIONAL SCRIPT - Finds And AutoLogs All "Birdies" In The Scanner
=====================================================================
```

Here is a CE-232 Script that is dissected and explained at each step. Its purpose is to identify all "birdies" in your scanner and log them to a file. A few subsequent manual steps makes a CE-232 AutoReject file that will prevent your scanner (PRO-2004, PRO-2005, or PRO-2006 only) from locking up or stopping on "birdies".

This next section below is 117-chars wide and may not appear "right" until you copy it to a word processor or text editor that can keep from wrapping wide text. NOTEPAD will do that. The left side is a comment section, line by line, for the actual script commands in the right side.

```
COMMENTS | THE ACTUAL SCRIPT CODE
=============================================|=========================================
============================
Remark: Forward slash (/), space and filename | / BIRDFIND.SCR
Clears keyboard buffer - always recommended | keyclr
Displays text line | msg1- This script can be
used to find and make a log file of all the
" " " | msg2- "birdies" that exist
in your scanner. The process takes about
" " " | msg3- 60-90 minutes,
depending on computer speed and scanner speed.
" " " | msg4- Short out the antenna
terminals so no signals can be picked up
" " " | msg5- and set the ATT switch
to -10 dB. Set SEARCH LIMITS of 25 MHz &
" " " | msg6- 1300 MHz with a SEARCH
ready to start upwards from 25 MHz. Put
" " " | msg7- in the MANUAL mode
before starting this script. Set the SQUELCH
" " " | msg8- so that no sounds come
in and get READY!
" " " | msg9- *****
Press G to start this script ******
NOTE 1:--\ | /
Idles script until the "G" key is pressed | idle until key = g
Clears keyboard buffer - always recommended | keyclr

Pauses script until SQUELCH breaks, then | idle until sqbreak = yes
Script command: turns AutoLogger On | autolog on
AutoLogs scanner display; idles for a moment | idle until count = 8
Script command: turns AutoLogger Off | autolog off
Script Loops back to the DO line just above | loop
Script runs indefinitely until User |
intervenes and stops it |
=============================================================================================
============================
```

NOTE 1: The script lines between the above NOTE 1:--\ and NOTE 1:--/
annotations serve to prepare the scanner for a thorough SEARCH of
25-1300 MHz by cancelling anything you may have already had programmed

in Limit Search Bank 9. To log ALL birdies, it is essential that the Birdie Search begin at one end of the spectrum and run continuously to the other end. Therefore, this routine ensures it by first narrowing the Search range and then expanding it. Otherwise, there is no assurance that SEARCH would begin at 25.000 MHz. When completed, you will have two or three AutoLog files that cover the Search period. Each AutoLog file is one-hour. Everything logged will be a "birdie", and so the next step is to edit the Log files, first by merging them into a single file....then edit out everything except the actual frequencies.

Let the below excerpt from an AutoLog file suffice for an example:

```
, 67, 47.5000,nfm,D, ,Man , ,930902,221114,000000
, 3, 49.8300,nfm,D,L,Man , ,930902,221048,000000
, 21, 95.7000,wfm,D, ,Man , ,930902,221055,000000
, 15, 97.3000,wfm,D,L,Man , ,930902,221053,000000
, 69, 121.5000, am,D, ,Man , ,930902,221115,000000
, 72, 122.9250, am,D, ,Man , ,930902,221116,000000
, 73, 123.1000, am,D, ,Man , ,930902,221117,000000
, 74, 148.1500,nfm,D, ,Man , ,930902,221117,000000
, 9, 150.5700,nfm,D, ,Man , ,930902,221050,000000
```

The idea is to prepare an AutoReject file based on the scanner's birdies for starters. See pages 65 and 70 in the CE-232 Manual and the <F1> on-line help for information on the REJECT feature and REJECT files. In a word, a REJECT file consists of only frequency information, one frequency to a line, four decimal places with no stray spaces and no leading zeroes or leading spaces.

You would then use your text editor to edit out everything except the column of frequencies, an example using the above AutoLog file for which is shown below:

```
47.5000
49.8300
95.7000
97.3000
121.5000
122.9250
123.1000
148.1500
150.5700
```

The above, then, constitutes a valid REJECT (*.REJ) file. As you can see, a script makes quick work of identifying and logging all your "birdies". In closing, you will want to identify only "birdies" and not actual signals, so be sure to short out the antenna connector on the back of the scanner with a piece of wire inserted into the center contact and then wrapped around the shell of the BNC connector. You might then also wrap a piece of aluminum foil over the BNC connector for further reduction of signal entry. Last, but not least, set the ATT switch to the -10 dB

position and adjust the SQUELCH so that the static is just silenced and
then a little bit more. Turn SOUND SQUELCH off, too. Run the BIRDFIND.SCR
script when ready and allow 1½-2 hours for the complete search.

OTHER EXAMPLE SCRIPTS

In addition to the BIRDFIND.SCR, there are over 50 other Scripts on
the CE-232 Program Disk, some just for demonstration, but plenty more
that do useful work. You may never have to write your own, if you
sort through what's already there in the \CE-232\SCR directory. Some
of the better and more powerful scripts included are those written by
Ian Webb and Scott Sikes. Check out WEBBMNUA.SCR, WEBBMNUB.SCR, and
SYKES.SCR for some prize-winning examples. There are plenty of
others, too, so get to work! Your primary tool in the learning phase
will be a good text viewer (LIST, XTREE GOLD, Norton Utilities, etc)
and a good text editor, (QEDIT, MS-DOS EDIT.COM, NotePad, WordPad,
etc).

DEVELOPING/WRITING A SCRIPT
==========

Easy. First open a blank file with the text editor of your choice. On
the first line of the file, type a forward slash, a space, and a
filename in the conventional 8.3 DOS format. Next, type KEYCLR on the
second line. Here's what we've got so far:

```
/ AutLogLk.scr By Bill Cheek, San Diego, CA November 24. 1994
KEYCLR
```

Okay so far? Now let's set the scanner to Channel 1; start the
AutoLogger; and put the scanner into the SCAN mode:

```
chan = 1
autolog = on
scan
```

Still okay? Now, once the scanner starts scanning, life is boring
until something happens. What can happen? About the only thing of
significance I can think of is that the scanner will eventually detect
a signal and stop. So the idea is to put the Script into a "wait"
mode until that "something" happens, as indicated by a Squelch break.
Once there is a Squelch break, we want the Script to do something, so
let's make it idle for enough counts that the signal gets AutoLogged,
then LockOut that channel and send the receiver on scanning again. A
DO - LOOP is in order for this operation since there are apt to be
many stops over the course of time.

```
do
idle until sqbreak = yes
idle until count = 16
lockout
loop
end
```

That's it for a simple but potentially useful script. The result will be by the time you return that all active channels will have been locked out...and inactive ones will still be scanning. By the way, CTRL+A aborts any running Script. Here is the entire Script:

```
/ AutLogLk.scr By Bill Cheek, San Diego, CA November 24. 1994
KEYCLR
chan = 1
autolog = on
scan
do
idle until sqbreak = yes
idle until count = 16
lockout
loop
end
```

Save this file as AUTLOGLK.SCR and you're in business.

INCORPORATE "AND" AND "OR" LOGIC INTO YOUR CE-232 AND HB-232 SCRIPTS!
==========

It occurs to me that there is no AND / OR logic built into the CE-232 Script feature. Or is there? The following is one method of incorporating intelligent decision-making with AND and OR logical operators. Follow with me as I set an example of each:

AND LOGIC
=========

- Desired, but NOT possible Script statement:

```
IF FREQ = 158.970 AND CHAN = 43 THEN
:
:
(do something; doesn't matter what for this example)
:
:
ENDIF
```

====

+ Ok, it would be nice to do the above, but the below does the same thing!

```
IF FREQ = 158.970 THEN
IF CHAN = 43 THEN
:
:
(do something; doesn't matter what for this example)
:
:
ENDIF
ENDIF
```

Voila! Very useful AND logic! Now then.....

OR LOGIC
========

- Desired, but not possible Script statement:

```
IF FREQ = 158.970 OR CHAN = 43 THEN
.
(do something; doesn't matter what for this example)
.
ENDIF
```

====

+ Ok, it would be nice to do the above, but the below does the same thing:

```
IF FREQ = 158.970 THEN
GOTO labelname
ENDIF
IF CHAN = 43 THEN
: labelname
.
(do something; doesn't matter what for this example)
.
ENDIF
```

And there you have it: AND and OR logic for your CE-232 Scripts.

SCRIPT LIMITATIONS
==================

Scripts are a piece of cake for people who have a clue about programing. They are not particularly intuitive and we do not support them in the sense of "going the mile" to help others write Scripts, nor to help debug faulty ones.

When you buy a computer, programming skill and helps do not come with it in the price. Likewise, we do not sell scripting skills nor even support on scripts with the CE-232. The feature IS there, however, for those who are capable of taking advantage of it, or for those who want to learn and master the art.

Script file size is not a problem (only one line at a time is read and processed). GOTO's and/or GOSUB's to distant positions within the file will take additional time to reach but shouldn't be a major problem, especially on modern computers. Large files will require additional time to prescreen for labels when the script is first started.

The Script Feature is primarily useful for only the PRO-2004/5/6 scanners. It may or may not work with any others, and in any case, we do not contractually support the feature. It's a gift. This tutorial, the CE-232 Manual, and the Scripts included on the Program Disk and at our FTP site are the extent of formal support we provide for Scripts. We may or may not provide unofficial support via e-mail. If you are hopelessly bogged down in a Script, I guess you can try us in e-mail.

You can download sample and example Scripts from our FTP site at:

ftp.204.210.11.126 in the \pub\interfaces\scripts directory.

SUMMARY AND CONCLUSION
======================

Scripts allow the user to automate a host of scanner operations from a
plain text file.

Press F5 to popup the Script Menu. Available selections are:

```
+-----------------------------+
| *** Script Menu *** |
| run Script file .........F5 |
| Abort script .......Ctrl+A |
| Pause/continue .....Ctrl+P |
| Option: view script line |
+-----------------------------+
```

run Script file: This item actually starts a script running after
asking the user to select the filename.

Abort script: Terminates a script in progress.

Pause/continue: Pauses a script while it is running. The script
may be continued by reselecting this item.

Option view script line: This option, if enabled, causes the
currently executing script line to be
displayed at the bottom of the screen. This
is useful for debugging scripts.

NOTE: Commonly used scripts can be added to the script section of the
CE-232 Tools menu via the <F6> setup utility. The script may then be
activated without having to go through the file selection process.

Oh.

You're right, of course.

Such a connotation degrades all the world's queens,
including "shower queens".

I shouldn'a hada oughta said it that way.

Begging the pardon of the world's queens......

1300 MHz? <giggle>

> They sell these things as TV amps.

Right. Now consider that a snow-free TV picture needs about 1000-uV
of signal. That preamp of which you toot the bugle is designed to
accept a 300-uV (weak & noisy) input and pump it up to 1000-uV.

Well, when you have a 300-uV scanner signal, the S-Meter if you
have one, will indicate a good 10-dB above S9; hardly a signal that
needs preamplification. But when 0.25-uV goes into it, it's hardly
even close to the optimal drive and bias points. The Noise Figure
is apt to be grossly higher with such low drive.

> Now the one I have is about 8 years old. The last time I was in
> a R.S. store (6 months ago) they were back with the TV goodies.

Well, how's come you don't buy some more and peddle the hell out
of them? You could peddle 'em for double your cost..... and
retire early in Life.

>
> Yea, I know it has a pretty high noise figures but it brought the MILSATS
> from zero to weak and 100% copy. I don't have the technical savvy that you
> do but I do know what works and doesn't work for me.

One has to legitimately wonder if that MILSAT you heard wasn't
actually on some other frequency unbeknownst to you, and the
preamp just made it intermod in on the freq to which you were
tuned. You know.....a pseudosignal? <sniggling>

Lots of times, funky preamps will appear to work great when there is
something wrong with the receiver.....like a misalignment, or a
blown RF front end.....or even "tinkeritis".

But hey, man, enjoy the hell out of it if you like it. I guess
this business of preamps is a lot like lady folks. Some guys
like 'em skinny; some meaty; and some kind of on the heavy side.

I reckon some guys like their receivers to be bogged down with
intermod, images, overload, desense, and such. Far be it from me,
you crazy old fart, to put down what you like.

> spigot on the back of it!

Nooooo, I hadn't either. But Dorsey said or implied something about
fitting PL-259's to RG-8.... and of course, then there's the
requisite SO-239-to-BNC adapter to only add to the loss..... so I
went along with the program to point out gross problems with PL-259's.
Not that I'd actually use one..... but if you use RG-8, you're almost
commited to one....and an adapter. The alternative is COSTLY!

> And besides, those el cheapo Silver-plated
> teflon connectors you see at the ham shows are crap anyway. The
> impedance of them is decidely something other than 50 Ohms! Same goes

Well.....I dunno about the ham show paraphernalia, but Amphenol
always made about the best PL-259 around.

> use a preamplifier anyway.

Ohhhhhh gawd......not another preamp phreaque? But anyway, why use RG-8
when RG-6 is cheaper and otherwise comparable on the loss side and a hell of
a lot easier to route and work with? I'm talking scanners now......not

ham and not SWL and not transmitting of any sort. Just scanners..... and then I'm talking about a good rule of thumb that avoids verbosity and consumption of time when the time might not be appreciated.

> > But I still want to know WHAT preamp has good noise and compression

If that is the case, then I'll readily defer to a well designed GaAsFET preamp designed for 850 MHz. You'd have a real humdinger in that case. But that puppy sure ain't gonna hum down in VHF nor even above a gig-Hz. Narrow-band, low noise preamps have been around for a long time and I won't argue them for the most part......though there is a darned good reason why the older Motorola & GE land mobile radios never had preamps in 'em. The old MVP, fer instance, had the antenna feeding the mixer straight on, and a preamp was an expensive option.

> > More than likely what you heard was increased intermod, images, and

> antennas.

Not THAT much wideband, though. Maybe +/- 5% or 10% of center freq. That still qualifies as narrow band in my books. And yes, those can work just fine under a well defined set of conditions. My point is simple.....the scanning environment is not a well-defined set of conditions, and preamps will almost always do more harm than good.

Well, hell yes, I'll buy THAT! But we sure don't see THAT level of detail on these newsgroups. People don't explain any more than absolutely necessary, and even then, gaping holes are left for the recipient to drive a mule-train through. But yeah, "properly" is your keyword there. Trouble is, "properly" rarely occurs outside the classroom...or perhaps

drawn out over a looooooooonnnnng time of interaction between two
well-meaning correspondents.

Here on the newsgroups, a newbie or apprentice asks a question, and
for one, he doesn't want a book or a treatise most ordinarily. He'd
usually be happy with a yes or a no, or in the alternative, a short
list of procedures and do's and don't. If the fellow wants more,
he'll ask for it. Few ask for much more.

> For instance if the original poster were interested
> in receiving a single "DX" channel and installed a pre-amplifier to do
> this he might give up if the scanner was being overloaded severely. If
> however, he was aware that a band-pass filter could be added between the
> antenna and the pre-amplifier to recover the DX signal clearly he would
> invariably go that route.

And then bail out when an hour later, he wants to scan something
else a few octaves away and hears the echoes of silence coming back
at him. I'll buy the narrowband scene for preamps. Not the wideband.
Them animals got more weight than oomph.

> > It's of cardinal importance that the entry level hobbyist
> > spend his money wisely and make few or no mistakes at the onset.
> > His chances of mistakes (and needless expense) are vast with

> And the possiblity of learning something even vaster......8-)

.....using RG-8 and a preamp? Sounds to me like a setup for a
very painful lesson, if you ask me. ;-) Let's take it easy on
the poor sap and steer him to a length of RG-6 feeding an antenna
mounted up there in the sky a ways..... When he's ready to grow,
he'll be johnny on the spot none the worse for the wear. Eh?

Two can play your silly game. But in this case, it is prima facie
that PL-259's are not suited for UHF. Professionals don't use them.
and you should know and accept that, even if you don't understand.
There is no requisite need for me to justify the idiocy of using
PL-259's much above 50 MHz. It is.....self-evident. Common knowledge.

Ummmmmmmm.......WHY don't scanners come with the MAR-6 built in?

> Building a preamp out of the MAR-6 is quite simple for anyone
> with basic electronics skills.

Yes....a MAR-6 amplifier is a nice learning toy and under
some situations, it can work. You will NOT get 0-2 GHz
performance out of one in an amplifier, however....not
any amplifier capable of being built by the hobbyist.

> No, you didn't give the "straight scoop" in your answer. You gave
> an answer that contained erroneous information in it and now you
> won't even admit it.

Well, then, why don't YOU give the straight scoop..... I have no
interest in playing any more pissing games with you. There is
no sense in it. I answered a specific question....and then you
come around pissing and squirting all over the place, and then
had the brass gonads to........

> Please note that I am advocating using preamplifiers primarilly
> when they are mounted at the antenna and when there aren't any
> strong RF sources in the area.

......hedge on your bets after all. Geez, man, that hedge has
already been taken.

> I'm now going to get a bit technical on you ....

Ferget it. I designed low-noise GaAsFET and bipolar preamps
for a couple of years.

> All of the formula I have used in the above calculations can
> be looked up and verified in the 1998 ARRL Handbook.

That is wonderful of you to take the time to so "educate" me.
Why didn't you lay it on the guy who asked the question, then?
10:1 says not one in a hundred read, much less understood, much
less WANTED to understand your lecture from the ARRL Handbook.

> > But I still want to know WHAT preamp has good noise and compression
> > figures for 25 MHz - 1300 MHz.

Geezus H. Kriste, man....just spit it out, will ya? Commit yourself.

> Ha ha yourself. You don't even know what dynamic range is

<Groan>

> > You have got to be kidding? Surely you jest? You're advocating
> > leaving a preamp on ALL THE TIME? For real? Well, if not a bypass,
> > then a gain control? But no, you said nothing of the sort. So
> > yo've got to be kidding?

> I keep repeating myself. If you live somewhere without any strong
> RF sources nearby, you can afford to give up some 1dB compression
> and third order intercept in exchange for a lower noise floor.

<Groan> My Paw used to say, "Son....*IF* the dog hadn't stopped
to take a shit, he woulda caught the rabbit." If....schmiff.....
Only an extreme minority of people live "somewhere without any
strong RF sources nearby". 90% or more of the population are in
a metro area for one; two, they're interested in DC-to-Daylight;
and three, they don't have the resources to do such a preamp "right".

You are talking the gross exception to the rule.....not only for the
geo-physical requirements....but also for the astuteness required of
the hobbyist who'd put such a preamp to good use.

> What about the case where someone who thinks he's an expert tries
> to give advice?

Ummmmmmmm....like you? If the inference is at me, well....I
dunno about this "expert" shit.....but I *do* have 35 years
in RF. And I was CEO of the company that made early Anglelinear
preamps. And I know or knew Fred Angle, Louis Ancioux, et al.
And I have designed major SCADA, earth-satellite, and other links
where the subject of our conversation is a bit more critical than
down at hobby level. Ignorant, am I? <Shrug> Okay.....

> Perhaps I'll agree with you about preamps. It seems reasonable
> that a beginner would be intimidated by talk of noise figures,
> compression points, and RF environments.

Geezus. Whew! Relief! That's like you finally 'fessing up
that the damn sky is blue after professing it's polka dotted.

> But I don't believe for
> a minute that the only people that read this newsgroup are entry
> level hobbyists.

No. But 90% of 'em are smack dab in the middle of Metropolitan
Downtown America.....and the other 10% would be better advised
to focus on the antenna installation FIRST before monkeying
around with preamps.......

trinit69@idt.net.nospam (Tom) wrote:

:I'd like to correspond with anyone who has successfully used the record
:feature on the 900XLT.

Speaking.

:This involves using the contact closure output on the back of the set to
:start a recorder via the recorder's remote jack.

It does.

:Naturally, remote jack equipped recorders are hard to find anymore with
:the advent of VOX being so common now.

You are looking in the wrong places. Radio Shack and others have a wide
choice of remote jack equiped tape recorders. I have yet to see a
cassette recorder without one.

:My VOX recorder has neither a mic input nor a remote jack and I'd have to
:buy a new recorder to use this feature.

It must have been the ultimate in cheapies.

:The VOX tape works OK, save for the fact that a ringing telephone, vac
:cleaner, or kids get recorded as well (so do burglars, though).

Connect a lead from the 9000s line output socket to the recorders mic
socket. Be aware that the line level is controlled by the volume
control. If you set the volume control to a comfortable level the line
out will be about right for the mic input.

:Comments on the use of 9000XLT record feature?

It works fine. The most useful thing though, is to bypass the mic by using
the line out to mic lead.

312. Re: Martin Lynch Information

Newsgroup: rec.radio.scanner
Date: 1997-12-03 00:00:00 UTC
From: malexder@aol.com
Message-ID: <19971203124601.HAA14040@ladder02.news.aol.com>
Source record: 178749

>Subject: Martin Lynch Information
>From: krkirkwood@sprintmail.nospam.com (Keith Kirkwood)
>Date: Tue, Dec 2, 1997 23:14 EST
>Message-id: <MPG.eeea6bbd7b6ed8d989688@nntp.a001.sprintmail.com>

>Anybody done any business with Martin Lynch in England?

I haven't.>Since they haven't answered any of my questions, I'll turn to some other
>sources. Your feedback greatly appreciated....

Have you contacted Javiation (www.javiation.co.uk/javiation) or Bandercom (www.bander.com)? I have bought scanners from both and I would happily do business with either again.

>1. If an order is placed for shipment to the United States, is VAT
>collected on that sale?

No.

>2. The ICOM R-10 that you sell, is that full frequency or cellular
>blocked?

Full frequency.

>4. What is the approximate shipping cost for UPS to the United States?
>
I don't recall, but I urge you to reconsider using UPS. Use registered air mail--not UPS or FedEx! It takes longer but you lessen considerably the risk that US Customs will intercept the package--you will pay import fees of $5-$50 on that Icom at the very least and Customs will seize the scanner at the very worst.

Once again, you duck the challenge, child. You are like the little kid who covers his eyes and thinks nobody can see him. Do you think that by chopping up and editing my original message that nobody else read it ? What a FOOL (in your own words).

My ID is as real as yours. I await mail from you. I'll post a different ID if you post your REAL sprint mail address.

I won't wait for you to complete my challenge on showing me relevant posts you've made, because you can't do it. I've already checked for you.

5 posts today from you - all full of shit as usual.

Oh, just incase you come up with some other excuse - like you couldn't find my challenge in Dejanews, well here's the url, junior:

http://x5.dejanews.com/getdoc.xp?recnum=4443166&server=db97p5x&CONTEXT=881085875.1851195496&hitnum=5

Now, get to work Johnny boy. Try and find some posts you've made that have anything to do with scanning as the challenge above states. Make sure to post YOUR dejanews url's too. I can't trust a loonie like you.

From: Newsont@interlog.com
Message-ID: <34856041.9BF0B1D4@interlog.com>
Source record: 178754

Does any one know where I can find a good list for trunk tracker codes
for the Toronto area.

I am specifically interested in Peel Region and Hamilton-Wentworth

Also, anyone have/know of a web page with freqs for the above areas

Please post and CC to newsont@interlog.com

318. Programing Regency RH256 Radios?

Newsgroup: rec.radio.scanner
Date: 1997-12-03 00:00:00 UTC
From: rmuth@hope.gordonc.edu
Message-ID: <881157584.21885@dejanews.com>
Source record: 178755

I need some assistance with self-programming a Regency RH256B two-way. I know that it can be done if one "activates" a jumper. But, there are two questions:
1 Where is the jumper?
2 What are the programming steps? (I assume that it is similar to programming a scanner, but I have no idea how to put in the PL Tone frequency.)

I appreciate any, and all, information anyone can give me on this. Please reply via e-mail (at least cc me via e-mail) as I do not have access to a news server that carries this group.

Regards,
Richard

Stop slamming one of the few companies that continually makes far superior performers than Uniden. My Regency MX-7000 (mfg by AOR), circa 1985, runs circles around any Uniden or RS/Realistic on the market. Sure, a 1985 scanner is slow and lacks some fancy features, but what good are features if the scanner can't receive worth a crap.

If you like lots of features, cruddy image-rejection, the most horrible 800/900MHz-stage ever manufactured, birdies and sensitivity in the neighborhood of 0.8uv, go and get one of them BC890XLT's or a used BC8500.

I can tell you two long and boring stories about getting parts, or should I say failure to get parts, from Uniden, too.

Renewals, like most alkaline cells, have higher internal resistance than nicad cells, which are better suited to high current drain applications (high intensity lamps, radio control vehicles, power tools, etc). When Renewals came out, people tried them in bright flashlights and reported veyr poor performance. They are suited for low and medium current drain applications (scanners certainly) but not high ones (the above, plus radio TRANSMITTING).

--------------D1450CD34CF
Content-Type: text/plain; charset=us-ascii
Content-Transfer-Encoding: 7bit

FOR SALE: Regency HX2000 Handheld Scanner ($30)

This scanner is currently NOT WORKING CORRECTLY. It has an intermittant
problem whereas when first turned on it will receive a frequency but
then fades away. Perhaps it can be easily fixed. It is in excellent
cosmetic condition (see attached photo) and features:

+ 20 memory channels
+ Covers 118-174, 406-512, and 800-950 (including cellular)
+ AM & FM modes
+ Direct entry
+ Search & scan features
+ Keypack lock, LCD lamp and more
+ AC adapter/charger
+ Sorry, do not have the owner's manual

If you're interested, please send e-mail to gabrown@bellsouth.net

Message-ID: <66476u$6a6@bgtnsc03.worldnet.att.net>
Source record: 178767

Sure, all you need to do is buy a Motorola Trunked Radio System,
motorola will then provide you free of charge a system key, a system key
that will only work on your brand new trunk system and not on anyone
elses. I think you can get a new Startsite system from Moto on sale now
for about $75,000. If you hurry, you may still be able to get the free
Quantar upgrade on the radios.

Was he expecting an audible warning? If so, there isn't one. But there is an indicator in the display (a flashing battery icon). If THAT didn't work, I don't know.

344. PRO-2046 Preprogrammed Freqs

Newsgroup: rec.radio.scanner
Date: 1997-12-04 00:00:00 UTC
From: Andy Ulrich <ulrich@null.net>
Message-ID: <667dl9$hff@bgtnsc01.worldnet.att.net>
Source record: 178431

I've got a PRO-2046 in my vehicle, and I really like it. However, a not-yet-sure-it's-useful feature is the four preprogrammed search banks ("Fire/Police/Emg", "Hwy", "DOT", and "Public Svc").

Not sure what the differences are between them, really. The first one is pretty obvious, and public service is presumably the "rest" of the FCC service codes which start with "P." Well, actually it isn't, because all of the "Public Svc" freqs are in the 800 band. And DOT and Hwy seem somewhat redundant, perhaps ... it's really a strange setup.

Anyway, I was wondering if anyone had already taken the time to actually list the freqs which are searched in each search bank. The manual doesn't do this; it only tells how many freqs are in each of the search banks. It's would be a bit of work, but it may be useful.

If you've got it and you can help, thanks in advance!

From the system owner/administrator or Motorola. If they won't give
them to you it's because they don't want your radio on the system.

>
>I believe you can try http://www.trunktracker.com

System keys are not available at http://www.trunktracker.com. There is
no reason for them to be there. The TrunkTrackers do not need System
IDs or System Keys. In fact, anyone posting these is looking for
trouble.

It may need another half hour, or you could put it in the microwave for
15 minutes. I'd try the microwave first, but only in 5 minute
increments (just to be safe).

There was a modification for that scanner that did away with the battery warning indicator so you could completely discharge the battery before your next charge up. That may be what's happened to the one you are speaking of. It never had a warning tone or beeper.

DENNIS in GA.

->
-> felt this overwhelmed when reading the directions. Is there any place
-> net that explains in English how to use this in the trunked mode. Ple
-> someone either e mail me or explain the steps in English.

It's really simple, once you've done it one time.

Start by holding down the 2, 9, and manual buttons while turning the radio on. That will completely reset and clear the radio.

Then, once it's on and cleared, press the 'trunk' button and hold it for about 2 seconds, until you hear a beep, and the 'data' and 'trunk' uin the display flash (I THINK that's the 2, they're on the left side, one over the other).

Then, program in the freqs for your system, and use the 'down arrow' button between freqs. Once you have them all in, press the 'search' button, and the radio should quickly (10 seconds or less) find the data channel and begin searching the system for any active talkgroups.

If you know the talkgroups you're interested in, you cqan now press the 'manual' button, and enter the talkgroup ID into any of the 50 'scan list' channels. There are 5 'banks' of 10 positions for the lists, and you can turn on and off each of the 5 banks separately. Once you have IDs in the scanlists, press 'scan' and it will ONLY stop on the talkgroups you set in the lists. Use search mode to find new or changed talkgroups.

He can't. He is clueless about all things electronic. He can't even hook
a
power supply up correctly.

> I just hope this finally shows everyone what a FOOL you really are (not that
> there was any doubt). I enjoyed exposing you. Thank you for the opportunity.

Toilet Boy has been showing the world what a fool he is for a long time.
He never
tires of giving everyone a chance to confirm it. That's because he has
such a
poor attention span, he can't remember ten minutes ago. If he didn't
have his
name (Toilet Boy) tattooed on his palm, he'd forget that as well.

You're right about that. Toilet Boy has been jealous of anyone that can
do anything electronically. So far, Mackey hasn't written a single
magazine
article let alone a book or three. He knows he can't do anything but
whine.
You have to admit though, when it comes to whining Toilet Boy really is
the Queen Whiner. He doesn't have the proper anatomy to be called King.

Perri Hatch wrote:
>
> I'm in the market for a new scanner...
Don't forget to look for Amateur Radio Flea Markets. I bought
a used radio shack PRO-46 for $80 at a market, and it covers most
of everything. VHF/UHF/AIR/900 MHz. The image rejection is bad only
above the cellular band so that you can receive 25 MHz of it only 1 dB
down, and this unit can be easily modified to cover the whole band.
Fortunately the image rejection is great in all of the other bands.
Note: If you are interested in the cellular bands, the triple conversion
high-end unit might not do the trick.

RS also has some good scanners that are on sale often... I used
to bash RS, but they have been providing much better
equipment in the last couple of years. I hear no complaints from
owners of the scanners and the 2 meter ham transceivers. I have
verified their performance under laboratory conditions. But I
do not recommend their connectors...

357. Active antenna for scanning - does it exist?

Newsgroup: rec.radio.scanner
Date: 1997-12-04 00:00:00 UTC
From: douglas@netcom.com
Message-ID: <douglasEKoqBG.5rI@netcom.com>
Source record: 178444

I live in a townhouse and the local board are Nazi's when it comes to doing anything to the outside of your unit (ie: putting up a big 'ol antenna).

I have an AR8000 and an 'ol Icom R1. I don't care what people say about either of them, I think they are both first class units, in their own way!

Anyway, I'm trying to figure out a good antenna solution for home use. I am all over the spectrum for listening, ~30mhz, ~47mhz, 155mhz, 450mhz, 800mhz, so it's hard to just pick one and find the idea antenna.

Lately I've been using a Radio Shack mag-mount car antenna, don't remember what I was thinking, it might even be a CB antenna for all I know. I just picked up the proper CB to BNC adapter at the olcal Rat Shack and put the mag mount antenna on some sheet steel and have it up at window level.

The receiption is suprisingly good, all over the spectrum. I've bought a variety of antennas for portable use, the best seems to be the Diamond 77CA.

I've heard of "active" antennas that are small, tube-like, unobtrusive, and (supposedly) fantastic at receiving. I could get away with mounting something like this out my second story window, as the locals would probably think it is just a weather station or security system device.

Do such things exist for scanning? Given my situation (the place is all wood construction, in suburban San francisco area), does anyone have any recommendations on something else to try?

A friend bought the Radio Shack discone and just had it sitting in his room. We found that the Diamond portable antenna seemed to perform better, but I don't know much about discone attennas to know how important it is for some sort of ground plane or height.

I've always sort of figured that height can make up for a crappy antenna, but I've severly limited in what I can do.

Anyone have any wild ideas?

Thanks to all, I'm a big fan of this newsgroup.

That is Right. HAM equipment is Hobby Equipment and NOT Professional. And at 440 the use of anything but a "N" connector is Stupid. It is only because of the "Amateur" Non Critical use that the Very Misnamed "UHF" PL-259 is used. If you will check you will find that ALL real Professional Antennas ONLY come with "N" connectors for that frequency and higher. Even for HAM use though don't you find it Courious that a 440 and above frequency antennas have a "N" connector Option? Have you ever wondered why?

Certainly you do know better.

There is NOTHING to be jealous of with Bill Cheek. He has no
reputable credentials so speak of.

> You should be a little nicer to him for I am sure that he has forgotten
> more about radio and scanning then you will ever know !

Scanning yes, radio no. Bill, AT BEST, has very basic &
dated knowledge of radio. For example, he claims to have
an FCC commercial license (which was discontinued 15 years ago)
& he suggests people tune oscillators with metallic tuning
tools (a BIG no-no).

Actually I think it is "sprintmail.net" or maybe "sprintmail.com".
I'm pretty sure on the "jjr001".

All in all, I couldn't care less because I use USA.NET so that
regardless of the ISP I still have the same address.

If it is really that important to YOU, then send e-mail
to those addresses & which ever does not bounce is it.

Personally, I don't care as I have NEVER pulled mail
from that address.

If you are receiving cellular freqs. on a PRO-2040 and they are not images, please let me know how I can modify my PRO-2040 to receive cellular frequencies. My understanding is that the PRO-2040 cannot be modified to receive the cellular band. Has anyone heard otherwise?

Robert,

I personally have had no problems dealing with Bandercom. They have a good reputation, but some people claim they are sometimes slow to deliver. That might be the fault of their country's postal service, though. Again, I had no problems at all.

To find out more about other people's experience with Bandercom, do the following:

Suggestion #1: Sort your headings by subject and you will probably see one or more "Bandercom" headings. That might help.

Suggestion #2: Go to a newsgroup archive program such as DejaNews. Then do a search on "Bandercom" and see what you find. Be sure to look at older postings as well.

Happy scanning.

Bill

David:

The Montgomery County area (including Conroe) switched to an 800 mHz system
about 1 year ago. I believe FD and EMS may still "simulcast" on their old VHF
frequencies, which are:
Tx
Rx PL
Montgomery Co. FD's 154.385 154.190 146.2
Rural/Metro-Mont. Co. 158.955 155.325 146.2

Don't know the 800 system freq's, or the old PD frequencies.

Hope that helps a little.

384. New FCC ruling

Newsgroup: rec.radio.scanner
Date: 1997-12-04 00:00:00 UTC
From: duane.vincent@greymatter.com
Message-ID: <881205675@greymatter.com>
Source record: 178590

The FCC has ruled that emergency 911 calls made on cellular phones must
be completed even if a customer's service has lasped.
People whoe cellular service has lasped can call 911 as long as the
phone's "mobile identification number" has not changed, the FCC said.
The identification number is generally the cellular phone number.

The CE-232 is far from a pece of junk.Its an interface that is still on the cutting edge of the technology,Why? you ask.Because of the open architecture.The interface and Docs give us everything necessay to connect to a computer with our Pro scanners and the ability to write our own programs to do what we want.The only unfortunate thing is not many folks take advantage of the script writing feature.If someone versed in programming took a look at whats available here it could blow away anything out there.As it is its a great piece of equipment.The screen actually looks like your scanner, its user friendly,has autoprogram and autolog features and tons more.Just my humble opinion.I own 3.Ira Cooper

Gotta admit that the technical stuff in these posts boggles this
little mind.
But....Im currently in temporary accommodation and cannot put up an
outside antenna (usually use a Diamond 707 with my ICR7100).
For the time being, I am running a Pr0 2026 0n a set of rabbit ears
with a Jim75 preamp. Without the preamp, I can barely receive the
local police repeater. The preamp makes all the difference....the
repeater comes in fine. Freq is 78.5875.
Funny thing...at my previous residence I had good access to all the
local emergency repeaters with or without the Diamond 707 but the 707
allowed me to receive stations well outside the local area.
If you consider the Diamond antenna to be a preamp (I certainly do)
then I am sold on preamps.
Yes, the rabbit ears are a bit Mickey Mouse (Bugs Bunny ?) but that is
what I have to use for now. But the Jim75 makes them acceptable for my
immediate purpose.
Before moving house, the rig was my motel setup when travelling.
Only an interference problem when my computer is booting up....then
everything settles down and it works fine.
The PC is about eight feet away.
BTW...the selector on the 75 is set at wideband 25-2150 mhz because
that is the only one that includes the 78mhz band.
I am not trying to annoy anyone but feel that the experience of a
non-tech scannist might help someone.
Brian

> and retracting your original statement?
>
> --
> Bill Dorsey

I didn't see the original of this, but it seems obvious that there's a
difference here not in the basic answer, but in the *QUESTION*.
Let's try this:
Why would a scannist want a pre-amp in the first place? Well, it would
seem obvious that the incoming signal is too weak, and the scannist
believes that a pre-amp will improve his scanning hobby.
So far, so good.
However...
What does "too weak" mean?
Does it mean that the scanner being used simply is a bit poor in it's
amplification, and the user simply can't hear what's being put out? In
that case, an audio amplifier will be a better choice.
Does it mean (as it usually does) that the user can't quite pull that one

signal out of the noise floor? In this case, a pre-amp is useless, since it will raise *ALL* signals into it by the same amount. In other words, yes, it amplifies that one signal, but it also amplifies all the other signals, raising the noise floor the same amount it raises the wanted signal.
This is what's meant by saying that pre-amps for scanning don't work. It has nothing to do with lab tests, or dB ratings; it has to do with the fundamental characteristics of the pre-amps in the first place. They simply can't do anything but raise the total signal level into the receiver. They are not selective, and therefore can't actually make any given signal clearer, simply because they amplify the entire signal, not just parts of it.
A far better solution to the problem is alost always to be found in better antenna selection/installation.
Directivity 9the ability to aim the antenna at the signal source) and the gain achieved by tuning the antenna to the desired frequency will actually improve the reception of that one desired signal, while a pre-amp won't.

The person that called it a piece of junk is the same person that went to the Ham radio newsgroup and asked if it was OK to hook his scanner to a TV antenna. I wouldn't read too much truth in what he says. i doubt he has ever seen one.

I agree completely. I only use the preamp for certain applications. 95% it is not being used. Heck, when I get into the 140-160 MHZ area any amp will turn my scanner or receiver into a noise machine. I have too much local RF in my area at those freqs to use a broadband amp. I just don't agree with the statement that they CAN'T be used at all when they can for certain purposes.

Glenn

: It has nothing to do with what I like but what has worked for me. It is
: too bad after all this time you feel that I am unable to operate my
: receivers/scanners and can't recognize intermod, images, overload,
: desense, and such. Sheesh!
:
: > I reckon some guys like their receivers to be bogged down with
: > . Far be it from me,
: > you crazy old fart, to put down what you like.

: Bogged down? What does that mean? I can pretty much hear what there is out
: there to hear. My logs don't reflect being bogged down. I don't follow,
: what is bogged down?

: So Bill, help me out. I can hear signals on both my R7000 and 2004 with
: the preamp that I can't without. They aren't ALL images, the frequency of
: a number of them have been verified. (If nothing else is, the beacon
: frequency on the sat is a good frequency standard.) Where have I gone
: wrong? How is this happening?

Look guys-you are both right-to a point!
Some people do get good results with CATV type amps-they are not optimum
for scanner use, owing to, among other reasons, the noise figure tends to
be so-so.
But as I said above....under proper circumstances, they can be useful-not
every person who uses them will get front-end overloading or other
problems.

404. problems scanner genius

Hello,

Some days ago I was using a genius scanner with 256 levels of gray, and it worked perfectly, but I upgraded my operative system to W95 and the scanner stopped working correclty.

I have installed correctly (I guess) the board of the scanner, the drivers for win 95(because I think is the same for windows 3.11) and the software, without problems.

The fact is that when I start using the scanner the light switches on and every thing seems to work perfectly up to the moment when I press the button:
at this moment the scanner ignores me and it doesn't scans anything.

In order to check the scanner again I have installed it on a win3.1 computer and it worked fine, so the problem should't be in the scanner itself.

I have also tried to modify every switcher of the scanner without results.

Can anyone help me?

Thanks in advance

Please, email the answers to mailto: pandez@arquired.es because I have problems reading news from my server.

>figures for 25 MHz - 1300 MHz.

Build one. They are easy to build with MMIC's. MiniCircuits have some
good ones. Example:-

ERA-5, DC-4GHz, NF=4.0dB@50ohms, IP3=36dBm, Gain=20dB from 0.1 to 1GHz.

Pretty good figures actually. There are many to choose from, depending
on the specs you want. Easy to use too. I have one on my desk.

>More than likely what you heard was increased intermod, images, and
>pseudosignals. On the other hand, if you are in an RF-quiet zone,
>then a poorer dynamic range is not going to immediately show itself.

That does not mean the pre-amp is useless. It has uses, maybe not all
the time, but at least some of the time. Say you build a pre-amp with
10dB gain and mount it at the mast to compensate for line losses, I'd
call that a use for one.

Recently I picked up some scanners at auction and sold one to a friend. Well, it's driving him buggy. It's a Bearcat 100xlt and it gives him no warning when the battery is going flat. I've never had a scanner that didn't issue an audible warning so I wondered if this feature was somehow turned off (if that's possible). Your thoughts are appreciated (via e-mail please)....

DCK

P.S.- He ain't complaining..Otherwise it works great and for $20 he'll put up with it if necessary....

Actually, you will, at 1.3GHz at least. I have observed this with my
homebuilt unit. This is especially so if you are working satellites
for example, or if you are using a directional antenna.

>No. But 90% of 'em are smack dab in the middle of Metropolitan

Hi.

I am using Pro-2036 and this scanner receives cells (images) right in
the ham radio bands (902-928). [no wonder why it a became
discontinued product]

Just for curiousity, do the scanner users in US are allowed to listen
to cells by monitoring the ham radio freqs ??

should I shut down the rig to be nice ??

If I didn`t know better, I would say that you are jealous of Bill Cheek!
You should be a little nicer to him for I am sure that he has forgotten
more about radio and scanning then you will ever know !
Charlie

In article <348579bc.8682715@news.wwnet.com>, year7itch@usa.net (Iggy) writes:

>>What will this board actually let me do?<<

It will (mostly) eliminate the annoying jingle tones on the end of some Ericcson trunked systems.

>>I'm aware it is designed to enable Ericsson Edacs (analog) trunk tracking...<<

NO, it doesn't enable tracking at all.

>>Does it work satisfactory on a conventional scanner?<<

It works OK, but you must send in your receiver to have the device installed.

My BIG question is (tah-dah....) why does it cost so much? There was a device on the open market that did the same thing, and it cost only $19.95. And most users could install it very easily (solder 4 wires). That device went off the market, and suddenly the G-Wiz comes on the scene from another source at $90. WOW! I sure won't buy one at anywhere near that grossly inflated price.

Stoli126@aol,
> com
>

The process isn't too different from programming a conventional scanner. It
just takes a little getting used to. Let me see if I can help you here:

Step 1.
To enter the trunked programming mode locate and hold down the TRUNK button
until the scanner beeps twice. You'll know you did it right when all the
bank indicators start flashing at you AND you see TRUNKED in the display.

Step 2.
Next you have to tell the scanner what bank you want to program. Let's say
we wanted to program channels 1 thru 30 as one trunked system. That's bank
1, of course, so press 1. (If you have the BC 895, it'll be A instead of 1)

Step 3. Now we're ready to program the frequencies in "Trunked Mode".
Punch in the frequencies as you would with any scanner.

Step 4. When you've entered all the frequencies in the trunked system, you
need to select the fleet map. There are 16 presets which cover 99% of the
trunked systems in use, so chances are one of them will work. Press the
DATA button. If you know the fleet map, then you can use your Limit and
Hold keys to scroll thru them. To get E1-P10, for example, you press DATA,
then the Limit or Hold key until you see E1. Then push DATA again and do
the same until you see E1-P10. If you don't know the fleet map, just use E2
to start, as it is the default. When you've selected the fleet map you
want, press E.

Now the scanner will look for the data channel and then begin showing ID's
as they transmit. The manual should be able to cover it from there. If you
still can't get it working, call Uniden's customer service. The number is
in the back of the manual.

Hope that helps,
-Phil

418. AOR8000and Opto Scout for sale.

Newsgroup: rec.radio.scanner
Date: 1997-12-05 00:00:00 UTC
From: mr4july@interaccess.com
Message-ID: <34875fa8.16893502@NNTP.interaccess.com>
Source record: 178463

I have for sale the "famous" AOR8000 and OPTO ELECTRONICS SCOUT combination. The both of them are in excellent condition. The 8000 has been modified to be used with the Opto-scout and also has full 800 mghz capacity. The modifications were done professionally at Grove Electronics. The 8000 is one of the best scanners I have ever seen or used and it is no longer available w/full 800 megahertz tuning. I have used the 8000/scout combo to find frequencies at Comisky Park, the United Center, Arlington Park, Harrahs Riverboat Casino, various shopping malls, and just riding around in my car. You will get:
1. The 8000 scanner W/ manual-charger ac unit, and soft case. No antenna as the stock antenna was junk and is no longer in existence! The nicads have long faded out of the picture and I use alkaline batteries now.
2. The OPTO SCOUT version 3.1 with the cable to link to the 8000, and the ac adapter/charger unit along with a user guide and software floppy disk. No antenna came with this unit-none is included.
Again both of the units are in EXCELLENT condition used and handled by an adult at all times. The asking price for the combo is $800 which INCLUDES US POST OFFICE EXPRESS MAIL shipping to your door. This will make a great gift for yourself for Christmas or for that scanner lover you know. References are available at the Ebay auction site WWW.ebay.com by choosing the search function and typing mr4july@interaccess.com under the seller e-mail function. Any questions will be answered by E-mail.

77CA.
Back in the 70's using a terrible analog receiver long dead and gone, I used
to find that a CB antenna worked well for everything under <30Mhz. Even now
as I now much more about radio and antenna resonance, I still cant figure
out how I ever got below 25Mhz with such a poorly matched antenna system.
Back then I was more into SWL than scanning, but the CB antenna worked great
just as well.

Yep, operator error. If you are going to use a preamp learn when to use it.

> Look.....here is the bottom line: *sometimes* a preamp *can* make
> all the difference between hearing and not hearing. Precisely exactly
> how *sometimes* some attenuation makes all the difference, too. But

Duh? If you had READ the previous posts you wouldn't repeat what has been
said.

> Preamps are NOT especially recommended for any general purpose for
> a variety of reasons, one of which is that most preamps aren't worth

> connector in a line between antenna and receiver degrades the signal
> to some extent by not only loss, but also the injection of more noise.

This doesn't sound like your original "preamps don't work" post.

> Fundamentally speaking, preamps are NOT on the list of things to
> worry about by the apprentice or even journeyman scannist. You
> put 'em in line and take 'em out. In and out. You don't leave
> 'em in line; not if you're smart. Well, this amounts to wear and
> tear and leaves gaping holes for something else to go wrong.

I never said I used it for everything. You made a blanket statement that
preamps don't work. I said they can work. BTW, leaving the preamp inlne
"here" unpowered causes me no problem.

> .....but in the right hands at the right time, the right kind of
> preamp can and does make a difference. Just like an attenuator also
> makes a difference at times.
>
> Got it?

I had it when I first posted. Question is read your above statement and
see if you "got it". I never said anything different, YOU said "preamps
don't work". There is a difference, that you seem to have realized
finally, between don't work and there is a time and place when they do
work for the scannerist.

> > > I reckon some guys like their receivers to be bogged down with
> > > . Far be it from me,

>
> See above. You're not an entry level scannist. You don't need advice
> on that sort of thing. You apparently found something that works under
> certain conditions. Enjoy it.

I do. Why did it take you so many posts to admit that it? Broadband preamps can and do work in certain applications. Not DON'T work.

> Buy more.

Why? I only use it for MILSATS. That is really stupid advise.

> Sell 'em.

Why? I like my car, I don't sell them. I like T-bone steaks, I don't sell them. Stupid again.

> Retire early in life.

HUH?? what is this nonsense? Retire and preamps. What's the connection Bill?

> Take one to beddy-bye with you. Hug it. Love it. Kiss it.

What sense does that make. Do you sleep with your CE-232 interface? Your CB radios? Soldering iron? I don't get the correlation to using something that works and sleeping with said items. What is the connection Bill? All that sounds pretty stupid to me.

> But at the same time, I'd worry just a little that your receivers
> might be mistweaked or just drifted out of alignment...IF....that
> preamp works all THAT well.

Sheesh. One hand you say preamps work for certain cases then you say this dribble. Would you make up your mind.

> One time, I was messing around with a preamp, and was amazed at what
> a difference it made on some mid-distant signals. It made me think
> I had found the preamp to end all preamps.
>
> Then I discovered my ATTenuator switch was sitting in the -10 dB

>
> <groan>

Operator error again. tsk

> But you get my drift.....?

Sadly I do Bill. I wasn't clear enough in my post and not intelligent enough to read "Sometimes, preamps can work for specific situations" into your preamps don't work statement.

Excuse me, but this is utter nonsense. For all practical
purposes, the frequency responses of a tantalum capacitor and
an electrolytic capacitor are the same at audio frequencies.
Since most scanners use a 15 KHz filter on the IF, frequencies
greater than about 5 KHz are going to become more and more
attenuated anyway.

I'm not saying you shouldn't use a tantalum, but if you're
using decent quality components and if the values are the
same, either type should yield equivalent results.

|>There seems to be a deep dark secret concerning the codes.
|
|What codes are you people talking about? Codes for what? You plug the
scanner
|into a PC (buy or make a serial cable), fire up the software (Scantcat,
Radio
|Manager or other software), and press ALRT/RMT to put the scanner into
"remote"
|mode. What else do you need to know?
|
|Like someone else said: Read the manual and stop whining.

|Max Innis

I think you should know what the conversation is about before you accuse someone of whining. The codes we are talking about are the codes sent through the serial port to control the scanner. These codes have not been published. When I purchased my OS-456, Optoeletronics sent me a copy of the control codes free of charge. The ICOM R8500 control codes are in the manual. I also have control codes for the AR8000.

Some people like to experiment and perhaps write their own software for controlling scanners. They also might like to write special applications.

All I'm asking is, where are the TrunkTracker control codes? They are willing to sell you the scanner, but are unwilling to send the control codes to use it unless you purchase someone else's software.

You can get both from UNIDEN direct.
Just access their web site and you will find them. Less than $27. for
the battery pack and about $14. for the charger. If you need the access
code I can give it to you.

This is Emilio.
I was on flight 800, and I must say it was a bummer ride. I do not apreciate guys like you getting their giggles off of terror rides like that. I ended up getting fish in my lungs while you sat comfortably in your home by the fireplace with a radio.
Worst of all, my scanner got soaked.

Put in the following freqs and I'd say 99% chance you'll get it !
I live on e mile from a meijers that use 154.6 for the grocery area and
151.625 for security.

If you can get a look at the bottom of a Motorola radio and it has a
colored
dot, symbol or letter on it, you know the frequency it is on:

Blue 154.570 Brown 464.500 Green 154.600 Red 151.625 Yellow
464.550
Purple 151.955 White 462.575 Black 462.625 Orange 462.675 J
467.7625
K 467.8125, Silver Star 467.850, Gold Star 467.875, Red Star
467.900
Blue Star 467.925

Itinerant (Low Power)- 151.505, 151.625, 154.570, 154.600, 158.400,
451.800,
457.525, 457.550, 457.575, 462.575, 464.500, 464.550,
464.750

>
> That is Right. HAM equipment is Hobby Equipment and NOT Professional.

I guess the sarcasm was lost on you. Regardless of whether or not
Amateur equipment is hobby equipment or not, the fact remains that
it is designed by PROFESSIONAL ENGINEERS, and the success or failure
of their products is highly dependent on its competitive performance.
If UHF connectors compromised performance to an excessive degree,
there is no reason why they wouldn't switch to a different type of
connector.

> And at
> 440 the use of anything but a "N" connector is Stupid. It is only because
> of the "Amateur" Non Critical use that the Very Misnamed "UHF" PL-259 is

> come with "N" connectors for that frequency and higher. Even for HAM use
> though don't you find it Courious that a 440 and above frequency antennas
> have a "N" connector Option? Have you ever wondered why?

An ignorant generalization. Connector losses are primarilly due
to the creation of impedance mismatches between the connector and
the cable. Thus in order to minimize connector losses, you want
to make sure that the impedance of the connector matches that of
the cable you are using it with (and keep everything clean so
it makes a good electrical contact).

Guess what happens when you use one of your precious N connectors
with a good quality 75-ohm cable like RG-6? You create a mismatch
and the connectors loss increases! Similarly, BNC connectors have
a characteristic impedance of 50-ohms and thus should only be used
with 50-ohm cable if you want to minimize losses.

Since UHF connectors have a characteristic impedance of about 30-
35 ohms, they are not ideal for use with 50-ohm cable. However,
in many applications the additional loss caused by this mismatch
is acceptable. This mismatch becomes more critical at higher
frequencies, but you're unlikely to gain more than 1 dB or so
by switching a single UHF connector to an N connector until
you get well over 500 MHz.

The CTIA fuckers have been fighting this for a long time because they
like to market their phones to people who want to have the ability to
make an emergency phone call at any time. Now the bastards can't keep
collecting outrageous monthly fees for such minimal usage. All you have
to do is sign up, get your phone number, and then cancel your service.

Hey Wheeler, you fucked up on this one. Maybe the cell phone bastards
will take this out of your salary! Ha Ha Ha!

I use a CE232 on my Pro 2006. If you have a Pro2004/5/6, the CE232 is excellent. It is fully documented, nothing is secret or proprietary, and the user ports allow custom expandability. I have a keyboard memory bank selector, S-meter, and channel center indicator controlled and logged thru my CE232.

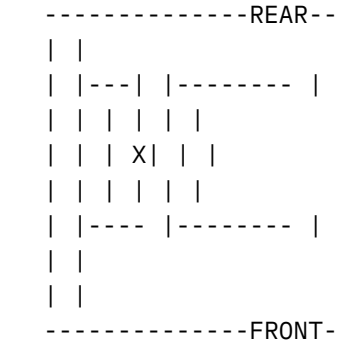
is GROUND. Plug the cable into a computer serial port and connect the socket
end to the radio. Make sure that whatever wiring convention you use, that the
connections depicted above are maintained (e.g. not reversed, etc...) I have
my socket end of the cable connected to the first three pins closest to the
AUX jack.

================================================================================
Discriminator (baseband audio output):
```

Look for the small 16 pin surface mount IC that is a MC3371. The baseband audio output is pin 9. I forgot to jot down the IC number but with the radio facing you and right side up, you'll notice that pretty much dead center on the printed circuit board is a whole slew of surface mount components. The MC3371 IC is over on the right and about midway between the front and the rear. The crude diagram below shows the approximate location of this chip at the 'X'.



Pin 9 (or any pin for that matter) is real hard to get to with a soldering iron. Proceed at your risk!

I soldered a small 1/8W 10K resistor to this pin and added a .01 uF capacitor in series to it. From there I run a small piece of shielded cable outside and I grounded the cable's shield with a small piece of wire to the screw near the AUX jack. The shielded cable is terminated with a female RCA jack. I did this rather than drill a hole for a panel mount RCA jack. I copied the hookup information from the numerous POCSAG decoder circuits on the internet but I kept the 10k resistor and .01uF inside the radio rather than risk dangling this IC's connection outside the radio. I was able to successfully hook up the baseband audio output to an op-amp circuit and feed a POCSAG decoder program,

Interesting note: This scanner has two areas on the PCB that are enclosed. One of them is accessible, the other has its access screws glued over with some epoxy to 'deter' you from getting inside. Also to the side of that enclosure is some more epoxy that looks like it's covering some parts up. I'm guessing this may be related to the cellular band lockout but I could be wrong. Besides what's to stop someone from using an up converter anyway ?

==========
Data format:

The BC895XLT communicates at 9600 baud, 8 bits, no parity, 1 stop bit. Using a shareware scanner program I found on the internet, I monitored the raw data between the computer and the scanner. That coupled with some guesswork yielded the following so far:

Note: You will need to put the scanner in the remote mode. Press and hold the ALRT/RMT button until the radio beeps twice. Also, the scanner is case sensitive - USE UPPER CASE LETTERS.

==========
AC: Clears all memory and resets the radio.

AR: status of LINE for AUX OUT
ARN: turns LINE on
ARF: turns LINE off

CC: responds with N - meaning unknown.

CD: CTCSS search function. Causes CTCSS in display to flash. Responded with 23 when it found a PL of 146.2.
CDN: function on
CDF: function off

CS: responds CSxx; xx two digit number representing CTCSS tone
CSxx: sets CTCSS tone xx (e.g. xx=11 for 97.4 Hz)

CT: CTCSS function - works just like DELAY above.
CTN: function on
CTF: function off

DL: responds with status of DELAY function - N for on, F for off
DLN: turns DELAY on
DLF: turns DELAY off

DS: unknown, responds NG

IC: unknown, responds NG

ID: Turns on/off trunk ID number being sent to data port while trunk tracking.
IDN: Sends ID number to port.
Format is: ID s nnnnnn; s=S while receiving, s=E at end of transmission. nnnnnn=trunk ID number.
IDF: turns function off.

IL: unknown, responds END.

IS: unknown, responds with letters ABCDE, bank numbers of some sort?
IS b: stores b into IS function. Multiple letters allowed but none higher than letter 'E'.

LL: read lower limit (for searching between frequencies).
LLfffffffff: set lower limit.

LU: read upper limit.
LUfffffffff: set upper limit.

LO: L/O (channel lockout) status
LON: lockout channel
LOF: restore channel

MA: reads data from current channel. Similar to above. Does not work while trunk tracking.

MAccc; ccc=channel number (e.g. 001): Puts radio to channel ccc and responds with data (e.g. C001 F04535000 TF DF LF AF RF N00). Will halt scanning.
Note: F=off, N=on
TF=freq. was entered as trunked (off)
DF: DELAY status (off)

LF: L/O status (off)
AF= Unknown
RF= LINE status (off)
N00=reflects CS number (CTCSS)

MD: unknown command that returns a two digit number.
01 is returned after a write to a memory channel
17 after a write through the RFnnnnnnnn command
07 when in trunk tracking mode.

MUF: opens squelch
MUA: closes squelch
MUN: appears to turn on an auto-squelch ? Can't unsquelch radio manually
in this mode.

PMccc: read contents of memory channel ccc. Does not halt scanning. Similar
to MAccc function
PMccc ffffffff; ccc=channel, ffffffff=freq.; Programs channel ccc with freq.
Note there is a space (ASCII 32/20 hex/SPACEBAR) between the last c and the
first f.

PR: status of PRIORITY scan function.
PRF: sets function off
PRN: sets function on

QU: Status of QU (activity indicator ?)
QUN: Unknown function, causes data port to output + if receiving a signal
and - if not.
QUF: turns off QU

RI: responds with status of unknown function - N for on, F for off
RIN: turns unknown function on
RIF: turns unknown function off

RF: responds with freq. in format ffffffff only if this frequency is set by the
RFnnnnnnnn command. If the frequency is already in memory assigned to a channel
then the scanner responds NG. Does not work while trunk tracking.

RFnnnnnnnn; nnnnnnnn=freq. (e.g. 470.5875 MHz -> 04705875): Dials up the freq.
in the radio (like the VFO mode) but does not program it into channel memory.
Scanner replies OK after command.

RM: Reads mode (e.g. NFM, AM, etc.)

SB: responds with bank letter(s)
SB b: goes to/turns on bank b. Multiple letters can be used. Works while
scanning. Does not work while trunk tracking.

SG: S-meter reading and frequency (e.g. S014 F04535000). No signal responds
S014 for me while a strong NOAA weather station returns S026.

SQ: responds - when squelch is closed and + when open or receiving signal.

SS: responds with END. Meaning unknown.

ST: returns 0000000 - meaning unknown. Produces error while trunk tracking.

WI: returns Wnnn Ffffffff; nnn=three digit number of unknown significance and Ffffffff where the lower case f is the frequency. Works in MANUAL or SCAN mode (example output: W084 F01541075).

==========

KEY functions. Just type KEYxx and carriage return; xx=number below. Acts the same as pressing front panel buttons.

Note: Some of the KEY functions producing errors are likely because the command is issued out of context. They probably are valid functions.

KEY00: functions SCAN button
KEY01: functions MANUAL button
KEY03: unknown
KEY04: HOLD function
KEY05: Toggles PRIORITY (same as PR)
KEY06: Toggles L/O (same as LO)
KEY07: steps up through channels (will not put radio into manual from scan)
KEY08: steps down through channels
KEY09: SRC button
KEY10: Turns on WX
KEY11: Toggles DATA skip function
KEY12: Toggles DELAY (same as DL)
KEY13: Toggles TRUNK button, not the function.
KEY14: Functions display dimmer
KEY15: Functions STEP button
KEY16: Toggles LINE function
KEY17: disconnect radio from computer (activated ALRT/RMT button)
KEY18: bank letters began flashing. Probably SEND button.
KEY19: unknown, displays flashing error.
KEY20: Toggles CTCSS (same as CT)
KEY22: Toggles FREQ/CHAN
KEY23: Toggles LOCK

KEY02 & KEY21: appear to be unused.

==========

I have been successful in programming the radio by creating a text file and sending it to the scanner. I had to introduce a small delay between characters so the data wouldn't overflow the scanner. Each channel and frequency is on a separate line followed by a carriage return (hex 0D) and line feed (hex 0A).

Update: My error, but my terminal program strips off the line feed (hex 0A). Apparently sending the line feed causes the radio to reject the data. TERMINAL.EXE from Windows 3.X has to have the 'Strip LF' enabled under the 'Following CR:' option. This is accessed by 'Send Text File' from the top memu. In BASIC, I just send a CHR$(13) which is just a carriage return.

For example: (the <cr> is invisible - don't type it. Using a simple text editor, the editor will actually append <cr><lf> where <lf> is a line feed)

PM001 04537250<cr>
PM002 04535000<cr>

PM003 00459400<cr>
etc...
==========
If anybody finds more commands or any other pertinent information let me know. I'll update this list as I find out more. For the time being, I'm using a Windows based terminal program to control the scanner. In the near future, I'll be writing my own application with Visual Basic.

Update: I have a QuickBasic Program that is working with the radio as a trunk identifier. The program displays the name of the talkgroup, signal strength, and operating frequency as traffic appears. For now, the talkgroup assignments are hard-coded with the City of San Diego Radio Trunking System.

You can't change frequencies or talkgroup information from the keypad - service mode or not. That can only be changed via the RSS (radio service software)

I think there might be some confusion here. Are you talking about a
BearTracker or a Trunktracker? The question was about the BearTracker. I
bought one for about $149 and that was a new radio. But if anyone is
willing to give me $200, it is theirs! I think BC makes 3 BearTrackers,
One that looks similar to the 700a (the BC7 , I asume this is the one in
question) and the other 2 look like radar detectors (BCT10 & BCT12) They
are not programable.

Good
scanning!

Kevin

I do not get that one. If the service has lasped, then there would be no phone number. You said that it would work if that number has not changed. If it is no longer there, that is a change, a change to nothing. That does not compute.

: end of tdragon in my address to respond,
: tdragonn@blarg.net

I doubt you will be able to add much frequency coverage to the '42.
And as for adding 66-88 Mhz(midband)-don't bother....you have to disable
30-54 coverage to get the 66-88-you can't get both at the same time.
Even if you did not mind using 30-54 coverage, the tuned circuts are not
tuned properly for 66-88-in fact not only is the tuning different, but
several parts have different values on a unit designed to operate at
66-88.
Also, in the USA, those freqs are mostly used for TV audio, wireless
mikes, and audio enhancement devices.
Almost all of the above use WFM.
Since the PRO-42 can not receive WFM, you would get a rather distorted
result.

steve: you have to read the manual that comes with it.

you have to do as it says to. You have to be able to
read the words and then put the scanner in the mode
it says to and then press the right buttons and stand
back...

Codes: they are no codes. They are inside and will not
come out to please you.

If you do things as the manual says to, you will be saved.

Just do the procedure One step at a time. Read carefully
and deliberately and proceed when the anxiety lessens.

Take deep breaths. The procedure is much like a woman having
a baby: plenty of pain and breathing which is enjoyed because
that is the way it's done...

In article <3487ffde.0@nova.zianet.com>,
D.Thom <nospammax@zianet.com> asked about G/Wiz:

>What is the device and where do I get one?

I published this in a 9/97 Monitoring Times G/Wiz review:

"...Scanning Ericsson EDACS trunked systems is more challenging.
When a station stops transmitting on an EDACS system, the repeater
carrier remains on the air and 3 annoying scanner-jamming beeps
are transmitted. While your scanner is stuck listening to the beeps,
the conversation has moved to another channel. Some hobbyists
have equipped their scanners with a G/Wiz board as a countermeasure."

"Simply put, the G/Wiz circuit instructs your scanner to start
scanning again as soon as it hears the first beep tone.
A G/Wiz-equipped scanner will not distinguish between talk
groups like a Trunktracker, but it will scan right past the beeps
to find conversations. The G/Wiz is touted as being able to skip
over mobile data terminal transmissions as well,
though we couldn't verify this."

"It is not designed to handle channels transmitting encrypted
voice or continuous control data, so control channels should
be locked out of your scan list for best performance."

"Broadcast engineer Terence Brennan originally developed the
G/Wiz to help news gatherers at his broadcast station monitor
the local sheriff's EDACS system. The G/Wiz became popular with
local scanner hobbyists and is now available through
Scannermaster (tel. 800-722-6701) and The Ham Station (800-729-4373)."

"G/Wiz can be installed in most Radio Shack and Uniden scanners,
including base and portable models. There are two versions of
G/Wiz. Each version is optimized to work in different model
scanners, so it's important to specify the make and model
of scanner when ordering...."

479. ICOM R8500 Computer Control

Newsgroup: rec.radio.scanner
Date: 1997-12-05 00:00:00 UTC
From: David Hitchner <nospam@nowhere.net>
Message-ID: <6699be$keu@bgtnsc01.worldnet.att.net>
Source record: 178545

Has anyone been able to make the R8500 scan at rates faster than about 10 channels per second under computer control. I have tried several computer control packages and have not seen a faster scan rate. The scanner by itself will scan at about 40 cps. This does not seem to be the case under computer control.

My OS456 which uses the same protocol (tested without using the enhanced features such a pipelining and hardware squelch detect) will scan at 25 cps+.

Is this slow scan rate simply a limitation of the R8500 under computer control? It seems to be a shame that such a fine (and relatively expensive) scanner would have this limitation.

Try http://www.uniden.com. Also http://www.speednet.com.

In a related vein, does anybody have track frequencies for short tracks in the mid-Atlantic region? Central Pennsylvania, Virginia, Maryland, etc. "Police Calls Plus" has a few, but mostly I've wound up having to ask around at the tracks I've been to.

(BTW, Police Calls Plus has a big list of race frequencies, but a printed book can't have the latest.)

Steve,

There seems to be a deep dark secret concerning the codes. I saw a post about a week ago about "BC895XLT I/O Information" that contained some hacked codes. The message contained a text file. Search Deja News for the message.

It would seem that publishing the codes would generate more support for the scanner.

This is hardly a feature. Image rejection is something designers have worked hard to improve over the years, ever since Armstrong invented the superheterodyne receiver. Many a person with a cheap receiver has suffered becaue of it's lack of image rejection.

If signals come in at an acceptable level on the image frequency, then that receiver isn't very good at doing what it's suppose to, namely receiving signals on the frequency where the image signal overrides.

And how do you know that you are in fact receiving cellular phone calls? I thought (though I haven't looked up the details) that there were cordless phones in that frequency range. That's the problem with receivers that have bad image rejection; you have to puzzle over whether you are hearing a real signal or an image.

In amateur radio, wide frequency receive coverage seems to have become fairly standard with 2meter equipment. Is it manufacturer's wanting to add another sales feature, or hams who have to be able to receive those "police bands"? But then people who buy those rigs turn around and complain about unwanted signals.

But there is a direct correlation between the "features" and the problems.

Would really appreciate information that will help me identify the frequency ranges of these two yagi antennaes. Neither of them have any identification. Didn't find anything useful searching the web under yagi and antennae. Does the ARRL_Antennae book include this information (I don't have access to one). Measurements are in centimeters.

Thanks.

493. Question about BC200XLT Battery getting hot

Newsgroup: rec.radio.scanner
Date: 1997-12-05 00:00:00 UTC
From: rbarile@bbn.com
Message-ID: <9VXh.4$ea2.172862@cam-news-reader1.bbnplanet.com>
Source record: 178559

I have two battery packs for a BC200XLT one of which I rebuilt using Radio Shack replacement batteries. This worked fine for about two years. Now the battey pack gets really hot when I recharge it and the battery reads 7.82 volts when charged for about 12 hours. Anyone else have this experience? Is the charging circuit going bad? Maybe I should throw the entire pack away before it starts a fire. Any advice is greatly appreciated. By the way the other pack (original equipment replacement) charges up fine.

Try the ICOM PCR1000 - it seems to fit what your asking for.

>There seems to be a deep dark secret concerning the codes.

What codes are you people talking about? Codes for what? You plug the scanner into a PC (buy or make a serial cable), fire up the software (Scantcat, Radio Manager or other software), and press ALRT/RMT to put the scanner into "remote" mode. What else do you need to know?

Like someone else said: Read the manual and stop whining.

That's a TV preamp. Everyone knows about those. But if you
like it so much, hell, sell it! Sell a hundred. Sell a thousand!
See if I care. :-)

But you CAN'T always tell when a real signal is extraneously mixed
with other signals and then shows up 58.677543 MHz from its real slot.

> The few times I have heard channel numbers spoken by the operators they
> matched the freq I was tuned also. So where have I gone wrong?

Being born? I dunno. Luck? Sometimes, preamps can work for
specific situations.

I dunno. Maybe you got the opposite of a lemon? Maybe you got
this Super Duper WhizBang preamp that wasn't supposed to be
released to society, but slipped out the door before they caught
it?

> > But hey, man, enjoy the hell out of it if you like it. I guess

> too bad after all this time you feel that I am unable to operate my
> receivers/scanners and can't recognize intermod, images, overload,
> desense, and such. Sheesh!

I don't know any of those things and have no "feelings" one way or
the other. I, too, have a few preamps laying around here, and once
in a while, I will use one for a specific purpose. And when I forget
and leave the damned thing in-line and a week later, I get a host
of shit on another band that makes me wonder what the hell's going
on....it eventually always traces back to that wretched preamp,

It's a lot like that ATTenuator switch on the back of your PRO-2004.
Ever flip it to the -10 dB position for a specific reason and then
forget about it? And then a week later, wonder why the hell you can't
hear some signal you've never had a problem with before?

Look.....here is the bottom line: *sometimes* a preamp *can* make
all the difference between hearing and not hearing. Precisely exactly
how *sometimes* some attenuation makes all the difference, too. But
BOTH cases of preamplification and attenuation are for the exception
to the rule. Receivers are optimized for 99% of all operations without
either preamps or attenuators. In the right hands at the right time,
a preamp makes for a valuable aid to good scanning.

Preamps are NOT especially recommended for any general purpose for
a variety of reasons, one of which is that most preamps aren't worth
the powder to blow 'em to smithereens. Another is that most preamps
don't have the performance bandwidth of the scanner and so will leave
the scannist sucking rocks when he's done with the intended purpose
and traipses off to do some general scanning. And three....every
connector in a line between antenna and receiver degrades the signal
to some extent by not only loss, but also the injection of more noise.

Fundamentally speaking, preamps are NOT on the list of things to
worry about by the apprentice or even journeyman scannist. You

put 'em in line and take 'em out. In and out. You don't leave
'em in line; not if you're smart. Well, this amounts to wear and
tear and leaves gaping holes for something else to go wrong.

.....but in the right hands at the right time, the right kind of
preamp can and does make a difference. Just like an attenuator also
makes a difference at times.

Got it?

> > I reckon some guys like their receivers to be bogged down with
> > . Far be it from me,
> > you crazy old fart, to put down what you like.

> Bogged down? What does that mean? I can pretty much hear what there is out
> there to hear. My logs don't reflect being bogged down. I don't follow,
> what is bogged down?

See above. A scanner with a preamp in line all the time is very
seriously degraded on its optimization curve.

> So Bill, help me out. I can hear signals on both my R7000 and 2004 with
> the preamp that I can't without. They aren't ALL images, the frequency of
> a number of them have been verified. (If nothing else is, the beacon
> frequency on the sat is a good frequency standard.) Where have I gone
> wrong? How is this happening?

See above. You're not an entry level scannist. You don't need advice
on that sort of thing. You apparently found something that works under
certain conditions. Enjoy it. Buy more. Sell 'em. Retire early in
life. Take one to beddy-bye with you. Hug it. Love it. Kiss it.

But at the same time, I'd worry just a little that your receivers
might be mistweaked or just drifted out of alignment...IF....that
preamp works all THAT well.

One time, I was messing around with a preamp, and was amazed at what
a difference it made on some mid-distant signals. It made me think
I had found the preamp to end all preamps.

Then I discovered my ATTenuator switch was sitting in the -10 dB
position.

<groan>

But you get my drift.....?

I suggest a tantalum coupling capacitor for the
simple reason that it is LOW LEAKAGE; does not
fail; and most importantly, because this tap
connects to the outside world where protection
is kind of important to those who have kids that
might stick something in there.

Tantalum is also more responsive to bass and treble
where out-of-band data is most often encoded. Getting
to and decoding this data is the whole idea of this mod.

Tantalum is the better choice for the coupling capacitor.

That J.I.M. 75 also happens to be one of the best wide band
preamps in existence. Maybe even THE best.....

I use mine to great advantage occasionally, too.

Well, I do NOT speak for the company whatsoever, but my
gut feel and educated opinion is that they are working
on a version that can go mobile. I have no clue to the
seriousness of this nor of any timetable, so take it with
a grain of salt until it becomes real.

In the interim, does anyone make a PCMCIA-to-ISA adapter?
I've heard rumors to that effect, and if true, that might
offer a portable solution to the existing WiNRADiO card.

>Would anyone have the frequencies for Lynn, MA, USA, police, fire,

Please don't misunderstand my intention--I'm not out to flame you... But gosh, with only a little bit of effort you can find out those freqs and probably learn something about the hobby in the process. Police Call, at your local Rat Shack cost a lousy $12 or so. Even if you don't want to spend the money, there are a number of sites that will give you the info--www.percon.com readily comes to mind.

Your post is so typical these days: Too many people--not just you-- are content to ask to be spoon fed info that a 3 minute web search will uncover if they made only a little effort. Maybe it's that scanning is not a hobby for them so they don't want to expend the effort. I can appreciate that--I don't understand it, however.

Source record: 178322

I have recently found out that the Radio Shack Scanners made by GRE (Pro 60, Pro 64, Pro 2041, and Pro 2042) are all being discontinued! Does anyone know why? I hope it's because GRE is developing Pro 43 and Pro 2006 level scanners again. Never mind the fact these scanners could be modified to receive cellular. Their sensitivity and interference rejection were/are above anything available on the market today. Maybe we are seeing a Microsoft taking over Apple situation here. The superior product (GRE in this case) being absorbed by the inferior but easier to use product (Uniden) company.

Someone pointed out to me that N connectors and BNC connectors are
available with 75-ohm impedances as well as 50-ohm impedances. Thus
you could use either of these types of connectors with 75-ohm cable
like RG-6 so long as they were of the right type (make sure they were
made to be used with whatever type of cable you use them on).

Check in your local Yellow pages under Television Antennas then look for
someone that sells Channel Master TV Antennas. If they don't have it they
can order it for you. At least it worked for me.

I am acquiring an older Regency HX-2200 handheld scanner 20 channels,
covers 118-174, 405-512 and 800-950 including cellular. Has a search mode.
Any known mods I should consider? Any operating tips, etc. that may be
helpful? I am a scanner newbie!

DO NOT SHIP YOUR EQUIPMENT BY MAIL BOXES ETC.

I went to the COMDEX computer show in Las Vegas. Like everyone I gathered up lots of literature and stuff to ship back home. IBM gave away free boxes so all I needed was to send it via UPS. I called a MBE store in Las Vegas and wanted to know if it cost more to ship my box from there, than sending if from the UPS office. They told me there would only be a slight service charge.

There slight service charge costs three times the regular UPS rate. MBE charged me 60.00 and UPS direct would of been $21.04. The UPS web site now has cost calculator for sending packages.

Be advised, don't do business with MBE unless you want to pay extra.

Both are good scanners!! I have a RS and my friend had a Uniden. Both work exceptionally well!! The RS might be alittle more, but I buy through Radio Shack for the 5 year TSP plan for about $60 extra. It's an extensive warranty for the unit. Please check in to the TSP plan before buying a Uniden. I have ahd RS products for 8 years and have used my TSP plans more than once for even simple repairs/adjustments. The plan pays for itself!!!!!!

Next year I suppose sunspotactivity will be high enough
that the Maximunm Usable Frequencies will be exceeding
30 MHz.
For that reason I am preparing and reviewing my frequenclists
between 30 and 50 MHZ.
So, if you have lists or information about the allocation
and usage of frequencies between 30 and 50 mhz, I would be
happy if you could send me this info.

In the US, the order of the month and date is opposite that of Australia.
In the US, 12-5-97 means December 5, 1997. In Australia it means May 12,
1997.

System Keys are 21 byte encrypted files that are unique to each system.
If you send me the system IDs of the systems that you need keys for, I'll
send make the system keys for you and email them to you. That goes for
anyone else that reads this.

Everyone, stop whining about this guy wanting system keys!! He asked,
we'll provide. If he is a malicious user attempting to screw up a
Motorola System....the authorities will catch him. If the guy just wants
to program his MTS-2000 to track his local system....more power to him!!

dbristow@wwonline.com -- I am awaiting you request

Have Fun...

547. Yupiteru 7100 question

Newsgroup: rec.radio.scanner
Date: 1997-12-06 00:00:00 UTC
From: Bill Masters <bogus@spam.not>
Message-ID: <01bd026d$9cf2f1a0$042da2ce@john58>
Source record: 178396

I am wondering how 7100 owners have organized their radios. The manual is useless for this task. What I have done is set up all the local public service frequencies in the actual channel memories. That way, when I hit scan, it finds whatever's going on.

For everything else, I am using the search bands. I have one set up for CB, one for my local NOAA weather station, one for broadcast AM, one for broadcast FM, one for SW (5-22 KHz), one for railroad, one for civilian air, one for military air, one for VHF emergency, and one for UHF emergency. I have locked out frequencies that have birdies or other extraneous clutter.

I don't know how efficient this is. It seems a waste to have 1000 channels of memory and only use 30 to 40 of them, but I found that programming other frequencies into the memory channels just got in my way of hearing police/fire/ambulance stuff, and the search bands seem better suited to my mood.

Anyone have any better suggestions? Are there other resources out there for better utilizing the features of the 7100? Thank you.

Bill

Cuz it's more popular in places other than North America?

I used to work for a company that made "professional" antennas. You
could order them with whatever termination you wanted. The gain claims
didn't change.

I'm not saying that PL259 plugs are the best but when properly installed
they really aren't that bad for 400-470MHz! There are plenty of ways
for hobbyists (and professionals) to mess up BNC and N connectors.

>Be advised, don't do business with MBE unless you want to pay extra.

If you ask MBE about this, they say their prices come straight from UPS and they have no control over them. BULL! They may get their prices on a disk from UPS, but that disk contains prices way WAY over UPS's standard prices.

For example, I had to ship a parcel to the midwest. It would have cost me $8.00 UPS plus a $1.50 service charge to ship it from my local Radio Shack. I made the mistake of taking it to MBE. They hit me for over $18 and then misplaced the tracking number on top of it. I could have sent it FedEx cheaper!

They may add a certain convenience factor, but their packaging services are horrible and their prices way too high for me to ever use again.

Bob,

Extra would be OK and expected. The outrageous amount extra that they
charge isn't! They usually pack pretty poorly too, while we are at
it. We got two heavy broadcast tape machines in at our business the
other day in flimsey (for 43lb. machines anyway!) 200lb. test boxes.
Amazingly they were OK. If they hadn't been UPS wouldn't and
shouldn't have covered the damage.

Best Wishes,

Jon Hall

The first thing to question here is if MBE and UPS both quoted on the same type of delivery service. MBE stores often try to seel customers Next Day, Next Day 2, or Priority Deliveries. Then they will come down to Select and Ground rates.

I just sent my Alinco DX-70T for repair this past monday. Prices started at $71 for Next Day and went down from there. I decided on a $31 Select as a quick way to hopefully get the radio back before the XMAS rush. Tracking it on the UPS web site showed it not only delivered, but a whole day early.

Just yesterday I sent another package at MBE and was equally pleased with the service. I brought in a shoebox with HT, charger, several batteries, etc. By he time I had filled out the forms the guy had wrapped everything in bubblewrap, put them back in the shoebox and had selected a new outter box and peanuts to pack it all in. They charged $4 in packing materials plus a $1.50 fee for packing service. With additional insurance and packing the total bill Was #21

Having used a private shipper before I am ver impressed with my local Mail Boxes ETC store. The big difference is in a reasonable packing fee, not to mention very quick work.

A few ways come to mind:
Use headphones or an earphone.
Use a powered speaker.
Route the audio out to a stereo.
If you want more power out of the Scancat's speaker, you're on your own
to find an amp to fit in or on the case.

From my FAQ article BUYING A USED SCANNER RADIO:

[...]

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor
receiver, you will probably want to buy more crystals to
cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack
store or from one of the companies below. Be sure to
specify the operating frequency you want and the brand and
model of scanner.

Some companies may ask you to send a schematic of the
scanner or require more detailed information, like series or
parallel resonance, load capacitance, etc.

Electra Corporation stocks crystals for the Bearcat
scanners:

Electra Corporation
11915 E. Washington St.
Cumberland, IN 46229

On my scanner, there is a little knob right next to the squelch that says
"volume" and it seems to have some effect on the sound coming out of the
speaker. That might be what you are looking for. :)

(Sorry, I just couldn't resist... sorry I can't offer any real info)

Thier prices here are 2 to 3 times what my drug store (that does UPS) charges.
They are the biggest RIPOFF I have seen around here. Service is OK but prices
WAY out of line.

596. Help With RS PRO-34 Scanner

Newsgroup: rec.radio.scanner
Date: 1997-12-07 00:00:00 UTC
From: DA Honeycutt <k3458@Vnet.net>
Message-ID: <348AE91A.58302AA@Vnet.net>
Source record: 178174
Cross-posted to: alt.radio.scanner,sci.electronics.repair,rec.radio.scanner

I screwed up!!! I was disassembling my PRO-34 to replace the headphone jack, removing the screws that hold the circuit boards, when I mistakenly turned one of the trimmer capacitors thinking it was a mounting screw. Now I have no idea how to properly adjust it.

Anyone with a schematic, service manual for the PRO-34, PLEASE take a look a C4 mounted on the main (mother) board and tell me what it does and how to readjust.

You just don't know how much I will appreciate your help,

David Honeycutt

Most of the Target stores that I've been in have radios which operate
on 151.625 and 151.925.

> made to be used with whatever type of cable you use them on).

If you wanna split hairs you can say that 75Ohms is not the proper input impedance for your typical 50Ohm receiver.

I come across this in professional installations where the technicians will re-tune the receiver with the signal generator on the input to the filtering/multicoupling. Often they will be able to improve the RX a couple of dBm's. What they are actually doing is fine-tuning the RX (which should be 50Ohms) to their mis-matched/mal-tuned filtering equipment, which is something quite other than 50Ohms!

I have not sat down and found out how many dBm's you'll lose if you go from 50 to 75 Ohms, or vice-versa, but I think it's safe to say it won't improve your reception and it's a step in the wrong direction.

With this said, it may be prudent to re-align the front-end(s) of your scanner after equipping your system with a 75 Ohm antenna.

This has nothing to do with it. Even the most non-technical scanner
user
can quickly ascertain if a crank of the volume control will clarify the
signal or not, Bill! 8-)

> Does it mean (as it usually does) that the user can't quite pull that one

Agreed. This is where the selective BP filter comes in - but let's not
confuse the issue!

> This is what's meant by saying that pre-amps for scanning don't work. It
> has nothing to do with lab tests, or dB ratings; it has to do with the

> given signal clearer, simply because they amplify the entire signal, not
> just parts of it.

That's why it's important to install the amplifier at the antenna and
not at the receiver. After all, you can't amplify something that isn't
there!

> A far better solution to the problem is alost always to be found in
> better antenna selection/installation.

I agree with this to be sure - but you must admit with many hobbyists
this is not a possibility. Especially cliff-dwellers.

> Directivity 9the ability to aim the antenna at the signal source) and the

> actually improve the reception of that one desired signal, while a pre-
> amp won't.

In some cases this will help. But in my opinion, directional antennas
are for the "DX" crowd and not casual listeners like me who listen to a
dozen different things from a dozen different directions at once.

Communications Electronics Inc. has the Bearcat 895XLT for only $239.95
when
you order package deal #UNI8PD as advertised in many magazines such as
Monitoring Times. To order, call 1-800-USA-SCAN or 313-996-8888.
The package deal includes the Bearcat 895XLT for $239.95,
mobile mounting bracket, part #MB001 for $14.95,
cigarette lighter power cord, part #PS001 for $14.95,
external speaker, part #EX711 for $19.95,
magnet mount mobile antenna with cable and BNC connector,
part #ANTMMBNC for $29.95,
plus $29.00 shipping/handling to anywhere in the continental USA.
Total package deal price is $348.75. To get this package deal price you
must mention offer #UNI8PD when you call 1-800-USA-SCAN.

There is also a similar package deal on the Bearcat 235XLT for only
$199.95 when
you order package deal #UNI2PD. This package deal includes:
the Bearcat 235XLT handheld trunking scanner for $199.95,
deluxe swivel belt loop leather carrying case #LC235 for $49.95,
cigarette lighter power cord #UA502 for $14.95,
magnet mount mobile antenna with cable and BNC connector,
part #ANTMMBNC for $29.95 plus $29.00 shipping. Total package deal price

is $323.80. To get the package deal price you must mention offer #UNI2PD
when
calling 1-800-USA-SCAN. If you prefer, a glass mount scanner antenna
with cable and BNC connector may be substituted for the magnetic mount
antenna at no extra charge. Offer expires December 31, 1997.

Hey gang!
I have a Realistic 4 channel crystal scanner, PRO-24
Covers 30-50, 144-174, 450-512 MHz
Has duck antenna, you can get crystals at Radio Shack
for about $5.00 each. Good scanner to monitor weather,
ham repeaters for Skywarn, etc.

First $20.00 plus $3.00 shipping, US gets it.

e-mail me at pjgreene@harborcom.net

Pete

> > weeny little issue.........

Contrary to what YOU say Bill Cheek, RG-6 (which is 75 ohm cable)
while delivering satisfactory service to a 50 ohm receiver, will NEVER
perform as well as 50 ohm cable would (such as RG-213 or RG-214 or
RG-8).
Using 75 ohm cable on a 50 ohm system gives you a SWR mis-match
of 2:1, then add the mismatch of the antenna itself (scanner antennas
usually are NOT well matched due to their broad banded design) & you
could
easily find SWR's of 5:1 or 6:1. Infact, 10:1 would NOT surprise me.

The problem with using anything other than RG-213 or RG-214 is that
if it is exposed to sunlight for more than a few years it
becomes VERY lossy especially at 400 Mhz and above. (5 to 10 db on a
long
run would NOT be unusual). This is caused by the UV rays
breaking down the dielectric

Pretty much all 50 ohm cables such as rg-6, rg-59, & 9913 have the
UV problem. RG-213 & rg-214 DO NOT have the UV problem (they are
known as "UV resistant").

> back up that statement with more than just my reputation and
> experience too.

The thing to remember here is a GOOD QUALITY pre-amp is needed.
They are tuned to a SPECIFIC range of frequencies to be low
noise. "Advanced Receiver Research" is a good example they have
(I think) about a 20 mhz window @ 450 Mhz & are useless past
that range. The average scanning hobbyist is going to want
something many times wider than that to amplify more
bands. That is not possible because all you will
get is high noise floors. The low noise floors is why
the GaAsFET is good, it produces very little noise &
is a favorite for use in receiving earth-moomn-earth
communications.

Hardly, son. YOU are the one blowing smoke to avoid the challenge.
For over a month you have been asked to provide your REAL ID (name
& e-mail address). Even after saying you would do so, all you
do is post a hotmail account & nothing else.

YOU are a COWARD that is blowing smoke, trying to avoid
the challenge that was put to you.

I have a 3 year old Uniden Bearcat 855XLT for sale. It has the original power supply, antenna, and manual. It has been modified for 100 channels, and full coverage of 800MHz, including cellular. This is a great scanner for beginners, and at $100 (shipping included), you're getting plenty of bang for your buck. Email me (make sure you remove the !), or reply in this group for info.

In article <348B276B.74A3@ibm.net>, Andy Moss <enzo@ibm.net> wrote:

> ... With this said, it may be prudent to re-align the front-end(s)
> of your scanner after equipping your system with a 75 Ohm antenna.

Hi Andy,

Front end realignment when using 75 ohm coax isn't
necessary, advisable, or even possible for current model scanners.

The BC9000XLT, PRO-2004, PRO-2005, and PRO-2006, for example,
employ a series of band pass filters ahead of any active
stage. The filters set the impedance and you don't want
to mess with them even if you could.

These filters are set at the factory and are not part
of the radio alignment procedures documented in their
respective service manuals. They rarely need repair
and you'll be in a "world of hurt" if you tweak them
without the proper care.

If you wanted to "readjust" the front end bandpass filters
(usually by replacing caps), you should use a tracking (or sweep)
generator in tandem with a spectrum analyzer as alignment tools
so you can observe the changes quantitatively across a band
instead of just measuring at one or two frequencies.

Older models, e.g. Electra Bearcat BC250/BC300/BC20-20,
have adjustable coils in the front ends. But they were
spec'd for operation using impedances in the 50 - 75 ohm
range. Look at the rear panel of these radios --
the antenna jacks are plainly marked 50 - 75 ohm.

To answer your question BOTH prices were UPS ground residential.

Did I note in addition to this they also charged me $5.00 to tape the box up. I thought this was their "service charge", but was only a charge for taping the box.

Dear MR. CB Guy

Over the years I have owned several different businesses. Not many
people knows better than I do what it takes to run a business.

I am not a cheapskate as you noted, but believe in being told the truth
and not mislead. That is my main complaint as noted.

It seem like on these newgroups there is always a few people like you
that like to take a cheap shot at posting like this. If you feel MBE is
for you then pay the extra costs. However I thought people would like
to be informed when we discover deceptive business practices such as
this.

The bottom line of my posting which you obiviously did not get, is they
are not telling the truth, and that can get you in trouble.

I have a friend who has the 235xlt, and the only time he picks up
cellular calls is when he's in the immediate vicinity of a celll
tower. (less than 1/4) I myself own the bc-895xlt and have yet to hear
ANY cell phones. I am within sight of 6 towers (all several miles
away) and still hear nothing. What I do hear is a lot of mobile phone
traffic on the business frequencies and images of the mobile phones
caused by intermod. I have yet to carry my scanner into an area where
intermod is a serious problem. In those areas it might be possible to
hear cell phones.

Hi there,

I have a Motorola DPC-550 Cellular Flip Phone for sale. This phone is one of those models that can still be converted into a "cellular scanner" before Motorola took that feature out. The phone comes with a overnight dual charger which charges two batteries at the same time, three batteries, one is brand new, one is used a little, and the third is also used a bit but is the "slim line" type. Also included is the Car DC Adapter. The phone is about as close to "brand new" condition as phones get. Very little used. I have the original box, all ESN and MSN info, lock/un-lock code and everything else except the original manual. Make a reasonable offer. May also consider a trade. I am in the Philadelphia, PA area. Thanks.

MBE is a RIP-OFF. The guy is right! They once charged someone who was
shipping to me $29 for packing. All they did was put the item into a
box!
Go to UPS, US Post Office, or someone reputable!

Message-ID: <19971207051501.AAA04196@ladder02.news.aol.com>
Source record: 178344

Hello to all,

I am in need of owner's manuals on: BCI, BCII, BCIV, BC-5, BC-6, BC-8, BC-12, BC-15, BC-140, BC-160, BC-170, BC-180, BC-201, BC-210, BC-210XL, BC-210XW, BC-210XLT, BC-211, BC-250, BC Alert and Jolly Roger.

And these service manuals: BCI, BCII, BCIV, BC-5, BC-6, BC-8, BC-12, BC-15, BC-140, BC-160, BC-170, BC-180, BC-201, BC-210XW, BC-211, BC Alert and Jolly Roger.

Also the following SAMS SD series: SD-2, SD-5, SD-8, SD-13 and SD-15.

And any Electra Bearcat sales literature, brochures, accessories, etc.

If you have any of these or if you know someone who does, please email. Will purchase outright or trade. Have antennas, power cords, some parts to trade.

Thanks in advance,

Bill aci6@aol.com

PS Do you have any of these scanners? If so, and you want to sell, please advise via email the condition, accessories and asking price (delivered).

Hello,

Im trying to find a person or company who could donate a 133 pentium based computer for a handicapped child as a christmas present. This child has a major case of Attention Deficit Disorder. We found that she can focus and learn while using a PC, however. As a matter of fact, she simply loves using a computer and she has shown signs of improvement recently after I gave her a 386 laptop, but the programs she needs to use that will help her are mostly pentium based. I also donated a monitor though its not as sharp as we would like for her to use, but if someone could donate just the pc, she could use the old monitor she currently has. The pc does not need to have more than 16 megs of ram, and a 1 gig drive. A CD would be needed, and a sound card would be nice, but not required.

If you can help, please contact me at david084@flash.net
Your donation could make a huge difference in the life of this teen who is really trying hard to learn at close to a normal rate.

Thank you.

david084@flash.net

>Has anyone tried installing the European CPU in the PRO 2042?

The only difference between the US and the Euro CPU in this scanner is cell phone capability, as far as I know. If you want to eavesdrop on phone calls, there are probably better approaches than swapping the CPU. I haven't checked recently, but the CPU is at least a couple of hundred bucks as I recall. For that money, you can purchase from Canada or Europe a handheld that will tune cell phone calls (in 30 Khz steps). The other option is to install an Opto OS535 (again bought from Canada or Europe). That should cost you about $200-$250. You'll be able to listen to cell phones and use your computer to control the scanner, which is considerably more useful than tuning cell phone calls.

Source record: 178357

I plugged in every freq that I can think of that is worth listening to in my 7100 and I have plenty of empty channels. I don't think of them as being "wasted" however. Having 100 channel banks seems like a good idea in theory, but it is really not all that practical.

I have my banks set up police, fire, emergency etc. by town and by county. I use the search banks pretty much the same way that you do (CB, FM, AM etc.)

When I scan, I select the bank(s) that I want and let it go. You can, of course, scan any combination of banks. One feature that seems quite handy--although I don't have much need for it--is the mode scan. Have you looked into doing that? Might be useful for scanning, say airbands (page 58 in my manual).

Last, there was a review on the 7100 written a number of years ago by Howard Bornstein, in which he mentions different scanning techniques (I think, anyway). Last time I checked, you could link to it from www.demon.co.uk/javiation.

Version 4.0 of PROgramit supports computer programming of the PRO-64 via its serial interface. Check out the PROgramit web page at http://www.qsl.net/ka2pyj. You will not need to build the interface as your radio has its own built-in. Drop me some mail if you have any questions.

Has anyone written a program to allow importing/exporting frequency data
files for the ICOM IC-PCR1000, computer controlled communications
receiver? I don't understand why ICOM would leave this function out.
The file is saved in plain ASCII form, so it shouldn't be too difficult.

Thanks,
Bill Crocker

Take your old pack to your nearest hobby store. They can make one with
higher capacity at half the cost of a standard replacement pack.

Wait! I'm not trying to cross swords with you, Bill - honest! There
are plenty of ways to amplify your audio output. You could amplify
enough to blow your brains out - but that's not the topic here.

> It's truly amazing how little extra noise gets in through decent cable.
> Even placing that pre-amp at the antenna will amplify *everything* the
> antenna hears, giving no individual signal any boost over any other
> signal.

This is going on the assumption that the signal you wish to receive is
buried in the mud. In a case like this I agree that there is no preamp,
antenna, coax or divining rod that will recover that signal. However,
band-pass filtering can help here but I don't want to obfuscate the
topic.

> > I agree with this to be sure - but you must admit with many hobbyists
> > this is not a possibility. Especially cliff-dwellers.
>
> True, but the pre-amp won't help them, either.

Untrue. If they are using a less-than-optimal antenna but their
receiver isn't completely swamped with shit, an RX preamp is just the
ticket!

> Then you are entitled to your opinion.
> However, in a "target rich environment" like here in Phoenix, a
> directional antenna is indeed very useful to isolate signals based on
> their geographic origin, giving these signals a real boost over signals
> from other directions.

I never said they didn't. When I refered to DX I wasn't necessarily
meaning the "shoot for the moon" crowd. I basically was refering to
those whom listen to signals outside of the range of normal ear-shot.

Do you know what became of 123.450MHz (AM) ?

I used to hear the commercial pilots gas-baggin' it on there but it's
been silent 'round here for the longest time. Did the FAA crack down on
it being used as an intercom?

Wrong, using 75 ohm cable on a 50 ohm system would yield an
SWR (not SWR's as you erroneously stated) of 1.5:1. An SWR of
2:1 would be a 25 ohm to 50 ohm, or 100 ohm to 50 ohm
relationship. Mathematically stated, SWR = Z1 / Z2 or
75 ohms / 50 ohms = 1.5, not 2 as you again erroneously stated.

Many broadband antennas used by scanner enthusiasts, such as
the discone actually have a fairly low SWR (1.5 or better) over
the tuning range, which is their chief virture. But, the big
drawback is the gain, which is very close to an isotropic
radiator, or somewhere in the vicinity of 0.5 dB across the
passband. Less than a dipole, but better than nothing. The
tradeoff is low SWR over the stated bandwith at the expense of
gain. For many listeners, this is a reasonable choice for an
alround antenna. In most cases, where the main activity is
receiving, the losses introduces by using 75 ohm cable on a
50 ohm system are neglible. Most of us who live in the real
world (not you Toilet Boy), know this. Many people have
greater (cheap or free) access to 75 cable. I tell them use
it. It won't be as good as the prime cable, but it will work
good enough.

> breaking down the dielectric

Half right. Many of the older coaxial cables made up to about
1965, and some of the inexpensive cables still made today, use
Polyvinyl chloride for the jacket. The jacket had an affinity
for the polyethylene used in the dielectric. After about four
or five years the cable did indeed become very lossy. In high

temperature environments, like in Phoenix where I live, can
happen sooner. The cables sometimes known as UV resistant or
noncontaminating are made of synthetic resin.

> Pretty much all 50 ohm cables such as rg-6, rg-59, & 9913 have the
> UV problem. RG-213 & rg-214 DO NOT have the UV problem (they are
> known as "UV resistant").

Wrong again. RG-6 and the foam version of RG-59 are 75 ohm cables.
Plain RG-59 is 73 ohm cable. The only cable in your list that
is correctly identified as 50 ohm cable is 9913.

Bill is right. If you mount a preamp on a vhf or uhf receiving
system AND live in a metropolitan area (like most of us Toilet
Boy instead of the fantasy land you occupy), cross modulation
products are going to overload the preamp. The user will end up
with multiple images and an odd assortment of strange noises
coming from his speaker. Even with a very well made broadband
preamp mounted at the antenna, cross modulation products will
be present. Narrow band preamps with several stages of filtering
can dramatically improve a station. But, not every listener
has the wherewithal to set up an array of remotely switched
narrow band filters to cover all the frequency bands of interest.

It's not so much the noise floor (not noise floors, you moron)
that will be degraded, but, that the radio front end will not be
able to handle all the wideband rf that will be stuffed into it.
It will groan and complain by introducing other noises and
distortion generated inside the device which will be audible
to the listener. See above.

Including earth moon earth systems, which are very narrow band,
is comparing apples and oranges. But, then again, that's just
what I expect from an ignorant wannabe like you Toilet Boy.

I have heard the hand launched Sputnik 40 with a Bearcat 60XLTvery easily the last few days. If you're interested you'll need a sattelite traking program (available at http://www.amsat.org) and the two line Keplerian set for RS-17. Frequency is 145.82Mhz. Sources say the transmitter is only 100 to 250 milliwatts but the "beep-beep-beep" it transmits comes in loud & clear. You'll notice the signal fade in and out, I believe this is due to rotation of the sattelite.

Good Luck,
Steve

Sounds to me like you really don't know. I have had a CE232 for three years and
its still great. I mean Opto and others have come out and none of them can
really match the CE232 in the entirety.

What is the matter with yours (if you got one)?

720. CE-232 interface

This will work on ANY dual conversion scanner. This is why you see RS and Uniden going to all tripple conversion schemes.

It is part of an unwritten agreement with the government. This agreement is why they won't sell you a service manual any more.

Our best response is to look elsewhere for radio products since all their newer radios are tripple conv. with many more "birdies " than I remember on the old ones(my pro60 has more than my pro51 and it makes searching almost impossible.)

Yes I too am thinking about the Pro-64, being at this time I am in the market for a new scanner while (hoefully) keeping my outlay to less that $250.00 bucks. I see that I can pick-up some Canadian 64's for about $500, this because of the full coverage. How about it, can the US version be modified, something tells me no... Thanks in advance. BTW having full coverage is alot more fun, although cell freqs do get boring after awhile...

I am a newcomer to scanning, and bought this trunk tracker from Uniden.

I like it , but am having trouble programming it.

I tried calling Uniden, and the tech lady was a tad rude .

Here is my question :

Why do I get a error when I try to program a frequency in bank 1 ? Like
154.650 or 155.430

Does each bank only accept certain frequencies ?

Also, I haven't been able to figure out how to do a trunk search.

Confused,
Peter

So, why you click on his post for? He clearly says "on E-bay". If you don't
like it, just don't read the post.
Some people just never understand....

OK Glenn, more than happy to prove I am a ham (Licensed amateur radio operator). Go to http://www.qrz.com & run the callsign of "KA0SSF".

There is no certification of radio in this country, only FCC licenses. Feel free to call the FCC & confirm my FCC commercial license (General Radiotelephone) #PG-GP-011350.

As far as a having "a clue about radios". I have built all my repeaters myself (6) & usually repair my own equipment. Can you say that?

Glenn wrote:

If the antenna is longer than about 60 inches, and about 1/2 inch diameter,
it is probably VHF-LO band, usually in the 30-50 MHz range.

If the antenna is about 18 inches long, and about 1/4 inch in diameter or 40
inches long with a 3 inch coil at the bottom, it is probably VHF-HI band,
in the 150-165 MHz range.

If the antenna is either 2 inches long and about 1/4 inch in diameter,
or about 6 inches long and 1/8 inch in diameter, it is probably in the
UHF band, in the 450-470 MHz range.

If the antenna is about 2-3 inches long and about 1/8 inch in diameter or 18
inches long with a coil in the center it is probably in the 800 MHz area.

If you can get a look at the bottom of a Motorola radio and it has a colored

dot, symbol or letter on it, you know the frequency it is on:

749. PRO-2042 antenna advice wanted, please

Newsgroup: rec.radio.scanner
Date: 1997-12-08 00:00:00 UTC
From: (unknown)
Message-ID: <348bf6a9.670851@news.pipeline.com>
Source record: 178213

I am new to scanning. I have a Radio Shack PRO-2042. The manual says that when connecting an
optional antenna, a 50ohm c0axial cable should be used. Radio Shack's Police Call suggests also
using a 72ohm cable made for TV.

My apartment complex has a HUGE radar dish behind one of the buildings. I have a 75ohm coax cable in
my apartment. Would it be good or bad for me to hook up my scanner to this cable so I can make use
of the radar dish?

Thanks

I am using 10 channel (46-49 MHz) Panasonic T4056C (this is a
very old model. I bought this a couple years ago... it works very
great...). This phone has a secure mode. I tested it with my
scanner and saw how it worked...

yes... you will be able to pick up some of the voices (secure on), but
it's very scratchy... and you have no idea what a heck someone is
talking about.

When secure mode is off, the phone works like a regular analog
telephone... you will be able to pick up everything completely...

It's very simple, MBE takes the rates off the standard UPS chart (I've
seen it in their stores, behind the counter) and doubles or triples
them. UPS doesn't discount, so if you go to any place _other_ than a
UPS shipping point, you'll pay more.

Many companies cut deals with their shippers for low rates. Check your shipping department to see if personal shipments are allowed. At our company they are nice enough to allow this, and we just write a check to the company for the actual shipping cost.

They don't mess with your mods. I just had them look at my 2004 a few weeks ago - all mods are intact. They sure did want a lot of money to fix it, though.

:
: Tell me this...does radio shack undo mods when they get a modified
: scanner or report it? Or does it depend on the location. I've been
: paranoid to take my 2004 in because of this.

760. Re: Why is the PRO-2006 so in demand?

And that's not all! Have CQ or 73 at $15 yr. Also, most computer magazines as well as Business, Family, Hobby, Girlie titles at great discounts. No better prices in America. I yr only, new or renewal. USA only. E-mail me with other titles you are interested in. Price quotes within a few hours. Happy Holidays!

From: wd4mni@nospam.mindspring.com
Message-ID: <348c388f.17956580@news.mindspring.com>
Source record: 178226

Hi,

Just so you know...
The BGPD has gone over to the new system as of last thursday. The TG
is 1200 for channel 1. If you use a trunk tracker that is.

The SO and Warren County VFD should be on line this week or
next...then the City fire will go on line.

It seems to be working pretty well so far. Just a few bugs in it.

The EMS trunking that was listed in this thread is not quite right.
There are just 7 channels. The Med Ctr uses the Nextel SMR on:
861.8125
862.8125
863.8125
864.8125
865.8125
864.3125
865.3125

Oh Yea, If you want to buy a new TT I will have them in stock in town
just email me.

Ben
WD4MNI(until the FCC processes my new call)

It never pays to assume anything about your customers. When I see a message
like that, I conclude that either the person making the offer doesn't really
have a clue, or that he intends to take advantage of others who don't know
any better.
```

> What about the PRO-2004?

Mention of any one of the PRO-2004/5/6 scanners is
tantamount to mention of all three. There are minor
differences from one to the next, but fundamentally
all three are the same design and "DNA" pattern.

Of the three, the PRO-2004 is my favorite.

> How can I fix it?

The best fix is probably a replacement of the
entire Keyboard PCB, part # GA-88D-7818, possibly
available from Tandy National Parts at (800) 442-2425.

You *might* could repair the problem with a careful
disassembly of the keyboard and overlaying rubber
keypad. Using isopropyl alcohol and a cotton swab,
gently clean the carbon or metallic traces that would
be on the PCB under the SCAN key. Also clean the back
of the SCAN key button.

This latter method is risky and could result in
more keys going defective even if you fix the one.
You're probably better off replacing the whole
Keyboard PCB assembly if you can get one.

Unfortunately, C4 is a fixed capacitor, 0.047-farad, down on
the Logic/CPU board. Its purpose is to "keep alive" the
memory when changing batteries, etc. It is not adjustable.

You'll need to re-examine the capacitor you tweaked and
better describe where it is located and on which board (there
are several) and none are properly called a "motherboard".

Be glad to help if I have more to go on.

I don't think that was his point. For one thing, Mail Boxes, Etc,
and other shopping mall reshippers usually charge only a small
extra fee over the normal UPS cost. He kind of indicated he knew
and accepted that. It was the 300% markup that chapped his hide.

Apparently, the COMDEX outfit tried to make a killing.

Consider that SportCat against the RS PRO-64 instead. For
fifteen bucks more, you get fourteen times more scanner.
And it's computer-programmable.

779. And the winner is...Pro-64 Vs. Sportcat

Newsgroup: rec.radio.scanner
Date: 1997-12-08 00:00:00 UTC
From: dieter2@ix.netcom.com
Message-ID: <66hf4h$ug4$1@server3.mich.com>
Source record: 178243
Cross-posted to: alt.radio.scanner,rec.radio.scanner

First of all, I want to thank everyone who responded to my questions!!

Well, it was a tough decision. Took both radios out on Friday night while watching trains and they both worked about equally well. The Pro-64 picked up a couple transmissions the Uniden missed and the Uniden picked up the Hot Box Detector a bit easier than the Pro-64 even though they both did pick it up. Some of this was dependant on how I was holding the radios at the time. The Uniden does have better sounding audio, the radio shack is a bit on the hissy side, maybe a home made mod will take care of that like a low pass filter.

I kept the radio shack, largely due to the features and the fact that most of the responses favored the Radio Shack and I had to return the Uniden by Sunday. I still have time to return the pro-64 if I need to but I hope to keep it and be done with this little dilema. I think I will get the radio shack telescoping antenna, seems to be pretty good, especially for $10.

Thanks again for all your help

> one of them soon....

The SC-150 is made by Uniden. Uniden peddles hordes of sizzle and not
a lot of steak. The PRO-64 is made by GRE-Japan. GRE peddles more steak
and not so much sizzle.

And....the PRO-64 is computer-programmable. You can load in 400-channels
of frequencies in 45-seconds. The "extras" it takes to do this wouldn't
cost a nickel over ten bucks, and probably not nearly that much.

Try finger-pecking in even 100-channels and see how long it takes.
And then what if you change your mind about what to monitor?

Have you tried the simple way out: Turn it on and adjust for proper
reception/maximum signal/proper frequency? As long as you only messed up
one adjustment, it is usually possible to get it back with fancy equipment!

Must add my 2 cents here from Conn. I just tried to have my PRO-2004
serviced by RS. Mine has the cellular mod.

It was returned by the RS repair facility. They refused to work on it
because it had the mod. My friendly sales person said it was against
the law for them to work on it.

Just a thought: You spend so much time saying so many bad things about John Mackey, that you are giving him quite a name. This much publicity could be the start of a great campaign for the White House in 2000. Or have we all forgotten that this is exactly how Slick Willie made it to the big chair in 92?

Nobody like a smartass, Andy.
Your vast experience notwithstanding, there *are* scanning hobbyists out
there who want more volume from their scanners.
...

It's truly amazing how little extra noise gets in through decent cable.
Even placing that pre-amp at the antenna will amplify *everything* the
antenna hears, giving no individual signal any boost over any other
signal.

> > A far better solution to the problem is alost always to be found in

True, but the pre-amp won't help them, either.

Then you are entitled to your opinion.
However, in a "target rich environment" like here in Phoenix, a
directional antenna is indeed very useful to isolate signals based on
their geographic origin, giving these signals a real boost over signals
from other directions.

"Secure" would be a relative term. I saw your response to a question about how you "listened" to a digital phone. What you described did not sound digital.

Just about any spread spectrum digital phone will be about as secure as most people will need. They are pretty much immune to casual eavesdropping. Your hard phone line to your house (which your cordless connects to) is probably more vunerable.

Anyone with the resources to break the coding sequences of a spread spectrum phone probably has the resources to listen to your calls no matter what kind of phone you use.

A note to the consumer. Not all 900MHz "digital" phones are spread spectrum. Some use basic digital methods and equipment for monitoring can be built from readily available products. Spread spectrum is usually referred to by one of its two common techniques, "direct sequence" (such as the Escort line which I believe was discontinued when Cincinnati Microwave went bankrupt) or "frequency hopping" (more common). There is also a hybrid technique that combines the two but I haven't seen any (haven't looked very hard myself).

I still have an 101, and the manual. Programming is done by setting the channel on/off switches. There is a long list of settings in the book, or you can figure it out by formula. If you want copies, send me $10 and I'll mail you copies (normally I would be glad to do it for free, but I just lost my job...you know), or I can send you the formula. There are too many settings to post them. I might consider sending you a program, for free, that will figure them for you, but you will have to wait two or three weeks.

Let me know what works best...

Below is a table of losses[1] that shows the difference between N connectors and UHF connectors at various frequencies. In your previous posting, you said, "And at 440 the use of anything but a 'N' connector is Stupid." When I pointed out that a number of manufacturers who most certainly employ professionals to design their (amateur) equipment use these connectors in their radios which operate as high as 440 MHz, you said, "It is only because of the 'Amateur' Non Critical use that the Very Misnamed 'UHF' PL-259 is used." Well, the table below shows that on a per connector basis, the UHF connector has a loss of 0.09 dB at 450 MHz. That means that a whopping 2% of the signal is lost in each UHF connector. When compared with your typical 50 or more foot run of even a good quality cable, this is trivial.

Now who is sticking their foot in their mouth?

--------- Type N ---------- ---------- UHF

FREQ (MHz) TOTAL LOSS PER CONNECTOR TOTAL LOSS PER
CONNECTOR
1.8 0 dB 0 dB 0 dB 0 dB
30 0 0 0 0
100 0 0 0 0
150 0 0 .02 .01
200 0 0 .03 .015
450 0 0 .18 .09
600 0 0 .26 .13
900 0 0 .66 .33
1000 .05 .025 .8 .4
1300 .1 .05 .86 .43
1600 .05 .025 .5 .25
2000 .05 .025 .02 .01

That doesn't prove anything John-BOY. SO you stole it or bought it. All you do is lie, this could be more of the same.

> There is no certification of radio in this country, only
> FCC licenses. Feel free to call the FCC & confirm my
> FCC commercial license (General Radiotelephone) #PG-GP-011350.

So you stole it or bought it from someone. Who knows. I don't even know that you are using your real name. With you, nobody can tell for sure what the truth is.

> As far as a having "a clue about radios". I have built all my
> repeaters myself (6) & usually repair my own equipment. Can
> you say that?

I haven't built a repeater but just about everything else, big deal? Yes I repair my own equipment. The only gear I have ever sent in to repair was under under warranty. So what?

I only have heard about you smoking power supplies and repeaters. You have never posted any technical information but go figure. I also doubt you "built" your repeaters. Did you etch the boards yourself? In reality you probably just used some old/used/surplus commercial stuff? If you are talking about taking commercial old/used/surplus and putting it on the ham bands I am not overly impressed. Fun to do but certainly not rocket science, more like remedial technical reading.

So John, let's both drop it and just talk technical or about scanner related stuff. You do own a scanner don't you John? How many? Base or handheld? Which models? What do you usually monitor with your scanner? What antennas do you use? How do you record/keep track of all the frequencies you listen to? Are any of your scanners computer controlled? If so which programs do you use? What kind of interface do you use? What's the favorite part of your scanning hobby? Which scanner related publications do you read on a regular basis? Books?

The Trading Post is a place your can read or post amateur radio, scanner or shortwave equipment. Items will be posted for 30 days or depending upon the amount of post on the board. Be sure to include any contact information and a honest description of your gear for sale.

It's probably worth reviewing what has been covered so far, since
there is apparently still some confusion.

First of all, it is the noise floor of the receiving system
(which includes the antenna, transmission line, and receiver)
that determines how weak a signal can be received (for now we
will ignore the dynamic range issue which comes into play when
there is a strong signal nearby possibly overloading the receiver).

Now, the noise floor is primarily determined by the first stage
in the receiving system. If a lossy transmission line is
connected between the antenna and the receiver, this is effectively
the first stage of the receiving system. If the transmission
line losses are greater than the noise figure of the receiver
itself, the noise figure of the system will increase to a value
bounded on the low side by the loss in the transmission line
(the lower the noise figure, the more sensitive a receiver).

Clearly, if a preamp is placed between the antenna and the
transmission line, it is the first stage of the receiving
system. So long as there is enough gain to more than overcome
the losses of the transmission line, the noise figure of this
receiving system will be dominated by the noise figure of the
preamplifier.

By now it should be clear how and why a good preamplifier can
improve the noise floor, and thus sensitivity of a receiving
system. It does _not_ do so by increasing both the signal and
the noise floor, but rather by _decreasing_ the noise floor
(in some cases).

If you have strong signal sources nearby (police, paging, etc.),
you should probably avoid using preamplifiers, especially of the
wideband variety as they may increase the strength of strong
signals to the point where they overload your receiver and either
mask weak signals, or create false ones.

802. BC 860 XLT

Newsgroup: rec.radio.scanner
Date: 1997-12-08 00:00:00 UTC
From: "Stephen D. Smith" <SteveD.Smith@digital.com>
Message-ID: <348C0BC9.2CFD@digital.com>
Source record: 178266

Hi,

A couple of people, myself included, have posted requests for
any/all mods for the BC860 XLT with no responses. Can we assume that
this is because there are no mods availble?

Thanks

Nah, the guy is probably just bored and being a nice guy. I sent him a
mesage and he fired a message right back that had a copy/paste from one
of the FCC database CD's or something. No commericial spam added to it.

*** Attention BC895XLT Trunk Tracker users
(Especially those in the San Diego area)
----------------------------------------
Attached is a freeware DOS application written specifically
for the Bearcat BC895XLT. Because it is freeware, you get
what you pay for. The program will not break your computer
or your scanner. However, you use it at your own risk.

So what does it do:

After the radio is put into the trunk tracking mode and the remote
control feature has been activated (and assuming all frequencies
have already been entered into the scanner), BCTRUNK.EXE sends a
command to the scanner that tells it to send the received trunk IDs
out its data port. The program gets this trunk ID and compares it
to the list of trunk IDs and assignments that are contained in the
..DAT file that was read in by the program. If the trunk ID is found,
the following information is displayed:

Example:

(12) ID:000208 - Northern Dispatch

The (12) means that this is the 12th time that trunk ID has come up.
If the trunk ID is not found, then that number is displayed in the
unidentified trunk ID section. On valid trunk identifications, the
program asks the scanner what the signal strength is and what frequency
it came up on. When the transmission goes away, the data is still
displayed until another transmission is received. At the bottom of
the screen is the .DAT file being used.

For additional information, view the README.TXT file in the archive.

10:1 would certainly surprise me. You have to quite close to a half
wave vertical to get that. Most 'random' whips end up as no more than
about 500 ohms.

Depends upon how good the cable is, how long the feedline is, and what
frequencies you are interested in. If you want to listen in on 900Mhz
or Cell phones RG59 type cables can be as good as about 13db per 100
ft, or as bad as 30db per 100 ft. (That means at best 95% loss per 100
ft, at worst, 99.9% loss per 100 ft.)

By contrast Belden 9913 is about 4.5db per 100ft at 900Mhz. (about 65%
loss). That is still 7 times the best you can hope from from RG59. It
will take one gigantic impedance mismatch to make 9913 as bad as RG59.

808. Repair of Sony ICF-Pro 80?

Newsgroup: rec.radio.scanner
Date: 1997-12-09 00:00:00 UTC
From: David Shine <hshine@bcm.tmc.edu>
Message-ID: <348DA325.2ADE37A3@bcm.tmc.edu>
Source record: 178022
Cross-posted to: rec.radio.shortwave,rec.radio.scanner,sci.electronics.repair

My Sony ICF-Pro 80 is no longer functioning well. Sony repair quoted me a price of $560 to repair it! (So much for customer support!) I'm wondering whether I could do something to get it working again.

Here's the problem. Upon powerup (with fresh batteries) I have no audio - but if left on I get audio in about 30 min. The thing must warm up. If, after I get audio, I turn it off I can get audio if I turn it back on within a few minutes. So, I'm thinking it is something to do with the power side of the machine.

Anyone have any ideas? I'm not afraid of experimentation since its pretty much a loss now.

Thanks,
David Shine

USHwy12 <ushwy12@aol.com> wrote:
>Does anyone know what the standard EBS / EAS alerting tone frequencies are?
>The one I'm most interested in, is the long 10 second dual tone standard tone.

That long dual tone "standard" was destandardized back in January of
this year. Some stations still included it to preceed the now standard
EAS encoded tones, mostly because there were some stations out there
which did not have the mandated EAS equipment installed yet, but at
this time, don't expect to be able to rely upon the dual tone EBS
alert for anything at all... other than receiving tests.

Even if you are assured that the station you monitor for the dual-tone
will continue to run it, consider that it is probably manually activated
prior to an EAS test sequence, and should the big day come for a real
EAS notification, the EAS might be triggered completely automaticaly
and not leave time for the board op to insert their personal protocol
procedures.

This has been discussed before. This is only true until the
antenna is above the average height of the terrain in the general
vicinity. Above that height, returns are greatly diminished.

> 2. The next most influential thing that can be done to a scanner
> system that monitors 25-1300 MHz is to use the best possible

> a general warning against the use of RG-8 due to varying quality
> and the potential for excessive losses due to PL-259/SO-239
> connector combinations.
>

Let's look at what you wrote a few articles back, Bill:

BC> Two can play your silly game. But in this case, it is prima facie
BC> that PL-259's are not suited for UHF. Professionals don't use them.
BC> and you should know and accept that, even if you don't understand.
BC> There is no requisite need for me to justify the idiocy of using
BC> PL-259's much above 50 MHz. It is......self-evident.

Can you point out a single correct fact in the above paragraph you
wrote?

Next lets see what you have to say about RG-8 cable:

BC> Some people will tell you RG-8 is good. It isn't, but it does beat
BC> RG-58 and RG-59. For the basic hobbyist, RG-6 satellite cable is
BC> hard to beat. It's cheap, but it is low loss.

Now, I don't know what measure you're using for "goodness", but I'm
talking loss here. And RG-8 is lower loss than RG-6 below 1.3 GHz,
period.

> Regardless of your iteration of lab test comparisons between
> Type N and UHF connectors, the land mobile market is rife with
> urban legends about weird and costly troubleshooting efforts that
> zeroed in on the inadvertent use of CHEAP CB-store PL-259 plugs
> in commercial installations; precisely the kind of connector that
> is apt to fall into the hands of the neophyte scannist.
>
Then why not warn users away from "CHEAP CB-store PL-259 plugs"
instead of spreading Fear, Uncertainty, and Doubt about them?

> This is not to mention the fair difficulty of properly installing
> PL-259 plugs so as to minimize loss and maximize performance. The
> neophyte-to-journeyman scannist is not apt to be able to mate
> PL-259's to RG-8 and maintain an unaltered 25-1300 MHz performance
> bandwidth of his installation.
>
Then why not warn users that are thinking of mating a PL-259 connector
to a RG-8 connector that they might either (1) buy a cable that already
has the connectors professionally installed, or (2) learn how to
install them correctly (many references, such as the ARRL Handbook,
discuss in detail how to do this)?

> Therefore, the greatest results coupled with least chance of error
> and a lowest cost produces one and only one cable for most scannists:
> RG-6 satellite cable with gold-plated Type F connectors, and the
> matching F-to-BNC adapter required for the scanner. This setup is
> low cost, quick and dirty, and has the highest chances of instant
> and long term success. Routing and handling is not a problem, either.
>
Then why not recommend this approach for those that are willing to
sacrifice a small amount of performance in return for a "quick and
dirty" solution? Instead, you erroneously claim this is the optimal
solution for everyone.

> It is a good recommendation. Hands down. And for those who sweat
> the 75-ohm characteristic impedance of RG-6 vs. 50-ohms, it makes
> not an iota of difference. The VSWR of a 75-ohm to 50-ohm mismatch

> but in view of the low loss of RG-6, coupled with its ease of use
> and installation of connectors, the 0.17 dB extra loss is more than
> offset by the gains.
>
Here you say that 0.17 dB of loss is "truly a hair to split," yet
earlier you were complaining about how lossy PL-259 connectors are
when in truth they are of the same order of magnitude.

> Except to someone who knows exactly what he wants and what it takes
> to get it, there is nothing wrong with the blanket recommendation
> of RG-6 satellite cable for scanner installations.
>
No, there is nothing really wrong with this statement. But there
is something wrong with the claim that this is _the_ optimal setup

for scanner installations -- which is false.

> 3. The third most influential thing that can be done to a scanner

> with whatever was left. The radio (quality) is the fourth most
> influential thing that can be done to a scanner system that
> monitors 25-1300 MHz.
>
You are greatly oversimplifying things. To the point that the
advice is not useful. To keep this short, if you are going to
spend a lot of money on a scanner installation, consult with an
expert before doing so and you have a much better chance of getting
things right than if you follow Cheek's advice.

> If you want to argue that a barely detectable signal without a

> (1) it won't be 25-1300 MHz widebanded, and (2) whether it is or
> isn't that widebanded, it WILL degrade a lot of reception over the
> band due to desense, overload, intermod, and/or spurious.
>
Once your antenna is a bit above the height of average
terrain in your area, raising it any further is going to have
a very small effect on weak signal strength. However, if you
are in an area without any strong RF sources nearby, installing
a good quality mast-mounted preamp with a noise floor equal to
or lower than your receiver and a gain greater than the loss
in your feedline will go much further in bringing in weak
stations than raising the antenna further.

A receiving systems ability to pull in weak signals is inversely
proportional to the noise floor (the lower the noise floor, the
more sensitive the receiver). Installing a mast-mounted
preamp with specs as discussed above will lower the effective
noise floor of the receiving system (antenna, preamp, feedline,
and receiver).

By lowering the noise floor, you have effectively increased the
signal-to-noise ratios of weak signals and thus will be able to
hear them more clearly and/or be able to hear signals you could
not hear without the preamp.

What part of this don't you understand?

Oh, and (1) you can buy preamps that not only work from .005 GHz
to 2 GHz, but also have flat response in that range. I've already
cited sources in an earlier article. And (2) installing such a
preamp will only degrade a receiver's performance if doing so
causes the receiver's dynamic range to be exceeded. This will
only happen if you (a) live somewhere with strong RF sources
nearby, and (b) use a preamp with too much gain.

> If you want to argue over where preamps fall in importance to a
> hobby monitoring post, 5th through 10th, that's your prerogative.

819. A decent scanner for under $80

Newsgroup: rec.radio.scanner
Date: 1997-12-09 00:00:00 UTC
From: "S. Lee" <modena@ibm.net>
Message-ID: <348DE063.7136@ibm.net>
Source record: 178033

Hello
I'm interested in scanners, I have been for a while, and this Christmas I've decided to ask someone for a scanner. I'm a complete beginner, and I don't know much except that most of the interesting frequencies to scan are between 25 MHz and 1000 MHz. If someone could recommend me a decent scanner that is designed for amateurs but isn't completely useless to experienced scanners(basically, one that I won't want to throw out after I get into scanning), I'd really appreciate it. Only condition for the scanner is that it costs under $80. Thanks in advance.

> >Does anyone know what the standard EBS / EAS alerting tone frequencies are?
> >The one I'm most interested in, is the long 10 second dual tone standard tone.

The attention signal is 853 + 960 Hz

47CFR11.11 addresses this topic. The two tone alerting signal is still required to be used with EAS. It must be transmitted after the EAS header codes. It is now only required before actual EAS emergency messages and for the required monthly test. The minimum required length of the alerting tone was shortend from 20 to 8 seconds. Required weekly tests don't require the attention signal, just EAS header and EOM.

Not to discourage you, but you will be hard pressed to find a decent scanner
for under $80.00 unless you get a used one or find one on a really good
sale. This is especially true if you want 800Mhz coverage.

822. OS456 firmware bug

Newsgroup: rec.radio.scanner
Date: 1997-12-09 00:00:00 UTC
From: johng@comm.mot.com
Message-ID: <johng-ya02408000R0912971824100001@news.cig.mot.com>
Source record: 178036

I thought I would pass the following along and hopefully save a person or two a few hours of debug time. I faxed this to Optoelectronics. They responded after 8 weeks saying "There are no known defects in OS456 firmware." They referred me to the developer of Scan Star for additional help. It appears that Opto wasn't inclined to investigate further.

I was using the OS456 (ew/ version 1.2 firmware) under RS-232 control the other night with a custom control program and noticed unusual operation. I am fairly certain that there is a firmware bug in the product.

After doing numerous writes (a variable number was required each time--somewhere between 10 and several hundred) to the 0S456 telling it to go to a frequency, the thing simply locks up and will not respond to valid frequency change messages. It will resond to other messages consistantly while in the "locked up" state (such as local mode).

It only has this problem if a mode is selected where OK/error responses are not returned to the frequency transfer message. It has the problem if I use adress 0x00 (broadcast) for the OS456 with either the 0x00 or the 0x05 frequency transfer opcode or if I use the 0x80 address with the 0x00 opcode

Once I have caused this "lock up" state to happen, the radio will issue the error response to a frequency write if a message that requires a response is issued. A friend of mine had the same results with his OS456 and his own custom program and PC.

I have worked around the problem by always using the 0x80 address and the 0x05 opcode, which always returns a response. I have the program wait 50 ms to avoid bus collisions.

The charge was for the materials (box and peanuts). The fee for doing
the packing is $1.50 regardless of size.

I use the CE-232 too. I love it!!. I just wish there were some new scripts to share. Back when Bill had his BBS you could find some good ones. I wish his WEB page / FTP site had an area or something where people can share scripts. I am still learning how to write scripts. Most of what I learned I got from other scripts. It is kind of like writing a batch file in DOS. The CE-232 can be very powerful if you just use your head a little.

Your claim was very narrow, a 75 ohm cable on a 50 ohm system. There is
no
"in theory" about 1.5:1 with the specified impedances. More dribble
from your limited experience.

> NO, actually the discone is the pretty much the only receiving
> antenna that has the virtue you describe above.
>

The circular curtain antennas used on Wollen-Weber systems and log
periodics are other examples of broad band antennas with low SWR
over the design range.

>
> It basically depends on wether quality is important to you or not.
>

It's easy to specify high quality materials when someone else is paying
for it. You neglect the fact that many people base their choices on
economics. An awful lot of hobbyists are filled with much enthusiasm
but lack the financial resources and fill their needs as best they
can. You still cannot escape the fact that 75 ohm cable will work on
a 50 ohm system reasonably well. Your limited mental capacity is too
stuffed with dreck and no experience to know such realities.

> You are so anxious to argue that you missed the point of what I said.

Message-ID: <348E184A.4644@cloud9.net>
Source record: 178046

Hello all...
My name is Brian and I own a RS PRO-60 and a Uniden Sportcat.

I have two bits of inf. for all you PRO-60 owners....

1)
I noted a page http://w5gb.nmsu.edu/kc5kto/handheld.html#pro60
which has some good inf. on mods for the PRO-60. Please note though that
this page is
wrong about one thing.

I'm referring to the 1+Enter trick mentioned in the opening paragraph.
This says that it will show you some test freq.'s....this is false.

Correction Note: By holding down 1+Enter and turning on the scanner you
will do
nothing more then display everything the scanner can show on its LCD
display. Quite
pointless, unless you are taking a picture of the scanner and need to
show it in that way :)

2)
That lead me to test other +Enter combo's.....

Note2: By holding down 2+Enter and turning on the scanner you will
disable that
annoying "beep" noise that the scanner makes every time you hit anything
other then the
light button!. To turn the "beep" back on, simply hold down 2+Enter and
turn the scanner
on again.

Thanks for listening....if you have any other tricks for this scanner
please let me
know.....thanks!

Brian

You're welcome! I keep hearing rumors Uniden is going to release this information which will definitely resolve some of the mysteries that still exist. I already had one success story with the DOS app I posted. I'm currently working on the Windows version (snapshot attached). However, I have to go back to my real job so that project goes on the back burner. I have no estimate for the completion date.

843. Pro 2006 Display Light - Modification

Newsgroup: rec.radio.scanner
Date: 1997-12-09 00:00:00 UTC
From: Kevin Fisher <klfisher@compusmart.ab.ca>
Message-ID: <01bd0455$c42c22c0$4022e5cf@kfisher>
Source record: 178068

Have you wanted to alter the function of the dimmer switch on your Pro 2006
?

Well here's how to do it: (This mod allow you so turn off the display
light when you depress the dimmer switch)

First: Remove the case of the radio, top and bottom.
The mod is done on the front board. (PC Board PC3 - The board that the
keypad is on.)

Second: Remove all solder connections for the shield overtop of the back
of the board and remove shield. Remove the screws holding the PC3
board in place and the front screws holding the Volume and Squelch knobs
in place. (Small needle nose pliers work well for this.)

Once you get the radio disassembled so you can see work on the PC3
board itself, you can start the mod.

All that is required is to remove 1 small component. See diagram below:

Each component is indicated with a ####. Be sure to remove the * * *
component.

#####

*
* <++++++ Remove this one only !!
* (Ensure there is no connection
between the top and bottom
contact of the component.
Removing it works best)
#

% % %%
% % %% Rear solder points for Volume and Squelch
% % %% pots.

Bottom of the PC3 board

(Sorry for the poor diagram ... but its accurate enough to do the mod.)

Once you can find the solder points for the volume and squelch pots (at the
bottom of the board) you should have no problem finding the item to be
removed.

Remember to be VERYcareful before removing any components .... make sure
you are removing the right one.

The author assumes no responsibility for this mod. If you are unsure have someone who is experienced in doing mods perform this mod.

Once the mod is done resolder the shield in place and put all the screws back in.

This mod will take less than 1 hour but it is well worth it.

I have also modified my Pro 2004 using a similar method.

Have fun scanning !

Yea right, I stole some FCC radio licenses & them managed to get them
listed in the FCC database under my name. RRRiiiight!!!

> With you, nobody can tell for sure what
> the truth is.

Only someone who has never known truth (like yourself) would have
that problem.

> I haven't built a repeater but just about everything else, big deal? Yes I

OK, you don't act like you would know any technical issues but perhaps
you
do.

> So John, let's both drop it and just talk technical or about scanner
> related stuff.

That is what we have asked you to do several times!!!! COOL, lets do
it.

> You do own a scanner don't you John? How many? Base or
> handheld? Which models?

Regency MX-3000 & an AOR handheld & BC-250

> What do you usually monitor with your scanner?

Law enforcement & fire dispatch.

That's true. I have become very famous!

Plus, a lot of people have written to me privately. Even friends
of mine in other states that I have not seen in quite a while
have noticed me here due to the others!!!!

I am sorry, I don't know what I was thinking. You are right, 50 to
75 ohm would be a 1.5:1, IN THEORY. However, with the POOR matching
of most scanner antennas, I bet that goes up MUCH higher. So the
impedence mismatch of the feedline would only serve to WORSEN
an already bad problem.

> Many broadband antennas used by scanner enthusiasts, such as
> the discone actually have a fairly low SWR (1.5 or better) over
> the tuning range, which is their chief virture. But, the big

NO, actually the discone is the pretty much the only receiving
antenna that has the virtue you describe above.

> Many people have
> greater (cheap or free) access to 75 cable. I tell them use

RG-214 & RG-213 are the only 50 Ohm cables rated for UV. The rest
DO NOT have that rating that I am aware of.

> Bill is right. If you mount a preamp on a vhf or uhf receiving

> with multiple images and an odd assortment of strange noises

You are so anxious to argue that you missed the point of what I said.
The high noise floor(s) on the frequency(s) in use would cause
the cross modulation you describe, commonly called "intermod".

You can't hardly say "Bill is right" because you don't seem to
comphrend enough of what is being said to track with the conversation.

> It's not so much the noise floor (not noise floors, you moron)
> that will be degraded, but, that the radio front end will not be
> able to handle all the wideband rf that will be stuffed into it.

YOU are the MORON. It's not "wideband rf" that the front end
can't handle. It is the front end overload of STRONG signals (that is
what limiter cicuits are for) & the lack of dynamic range in the
receiver.

> It will groan and complain by introducing other noises and
> distortion generated inside the device which will be audible
> to the listener. See above.

The issue you are talking about is commonly called
"Intermod".

> Including earth moon earth systems, which are very narrow band,
> is comparing apples and oranges. But, then again, that's just
> what I expect from an ignorant wannabe like you Toilet Boy.

We weren't talking about bandwidth, we were talking weak signals.
Bandwidth of a specific signal has nothing to do with what we were
talking about. (Get with it!!!!!)

All the MBE places must be allowed to do whatever they want. In one place in the N Mpls suburbs, I was charged $1.80 more for an approx. $10 shipment and $2.20 more on an approx. $14 shipment, than if I had driven 15 miles to the UPS place. Seemed fairly reasonable to me. Seems like the ticket is to call ahead and see if its a rip.

Information on the BC895XLT I/O port and data format |
From: A. Giammarino (agia@ix.netcom.com) |
Last Update: 12-09-1997:0038 hrs [New Code Info!] |
*** View with a mono-proportional font *** |
-----------------------------------------------------
Cable information:

Connectors used: Female DB9
1/2 of an 8 pin DIP socket
(cut in half lengthwise)

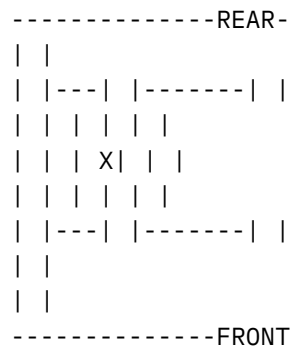
Wiring: DB9 Socket
3---------------1 data into radio
2---------------2 data from radio
5---------------3

Pinout on BC895XLT is such that pins 1 & 5 and 2 & 4 are tied together. Pin 3
is GROUND. Plug the cable into a computer serial port and connect the socket
end to the radio. Make sure that whatever wiring convention you use, that the
connections depicted above are maintained (e.g. not reversed, etc...) I have
my socket end of the cable connected to the first three pins closest to the
AUX jack.

=============================================================================
Discriminator (baseband audio output):

Look for IC3, a small 16 pin surface mount IC that is a MC3371. The baseband
audio output is pin 9. The MC3371 IC is over on the right and about midway
between the front and the rear. The crude diagram below shows the approximate
```

location of this chip at the 'X'.



Pin 9 (or any pin for that matter) is real hard to get to with a soldering iron. Proceed at your own risk!

I soldered a small 1/8W 10K resistor to this pin and added a .01 uF capacitor in series to it. From there I run a small piece of shielded cable outside and I grounded the cable's shield at the screw near the AUX jack. The shielded cable is terminated with a female RCA jack. I did this rather than drill a hole for a panel mount RCA jack.

I copied the hookup information from the numerous POCSAG decoder circuits on the internet but I kept the 10k resistor and .01uF inside the radio rather than risk dangling this IC's connection outside the radio. I was able to successfully hook up the baseband audio output to an op-amp circuit and feed a POCSAG decoder program.

Interesting note: This scanner has two areas on the PCB that are enclosed. One of them is accessible, the other has its access screws glued over with some epoxy to 'deter' you from getting inside. Also to the side of that enclosure is some more epoxy that looks like it's covering some parts up. I'm guessing this may be related to the cellular band lockout but I could be wrong. Besides what's to stop someone from using an up converter anyway ?

==========
Data format:

The BC895XLT communicates at 9600 baud, 8 bits, no parity, 1 stop bit. Using a shareware scanner program I found on the internet, I monitored the raw data between the computer and the scanner. That coupled with some guesswork yielded the following so far:

Note: You will need to put the scanner in the remote mode. Press and hold the ALRT/RMT button until the radio beeps twice. Also, the scanner is case sensitive - USE UPPER CASE LETTERS.

==========
AC: Clears all memory and resets the radio.

AR: status of LINE for AUX OUT
ARN: turns LINE on
ARF: turns LINE off

CC: responds with N - meaning unknown.

CD: CTCSS search function. Causes CTCSS in display to flash. Responded with 23 when it found a PL of 146.2.
CDN: function on
CDF: function off

CS: responds CSxx; xx two digit number representing CTCSS tone

CSxx: sets CTCSS tone xx (e.g. xx=11 for 97.4 Hz)

CT: CTCSS function - Tone Squelch.
CTN: function on
CTF: function off

DL: responds with status of DELAY function - N for on, F for off
DLN: turns DELAY on
DLF: turns DELAY off

DS: Toggles the DATA button (data skip)
DSN: function on
DSF: function off

IC: While trunk tracking, sending a KEY04 and then IC reponds with a scan list bank and number followed by the trunk ID number.
(Example: IC A1 001776 - where trunk ID 1776 is stored in trunking scan list bank A, slot 1. See page 45 of user's manual for details.

ID: Turns on/off trunk ID number being sent to data port while trunk tracking.
IDN: Sends ID number to port.
Format is: ID s nnnnnn; s=S while receiving, s=E at end of transmission. nnnnnn=trunk ID number.
IDF: turns function off.

IL: Responds with list of locked out trunk IDs.

ILR nnnnnn: While holding a trunk ID, locks trunk ID nnnnnn out.

IS: responds with letters ABCDE or sometimes NG. This is related to storing the trunking ID scan lists.

IS b: stores b into IS function. Passes bank letter to IS function.

LL: read lower limit (for searching between frequencies).

LLfffffffff: set lower limit.

LU: read upper limit.

LUfffffffff: set upper limit.

LO: L/O (channel lockout) status
LON: lockout channel
LOF: restore channel

MA: reads data from current channel. Similar to above. Does not work while trunk tracking.

MAccc; ccc=channel number (e.g. 001): Puts radio to channel ccc and responds with data (e.g. C001 F04535000 TF DF LF AF RF N00). Will halt scanning.
Note: F=off, N=on
TF=freq. was entered as trunked (shows off)
DF: DELAY status (shows off)
LF: L/O status (shows off)
AF= Unknown
RF= LINE status (shows off)
N00=reflects CS number (CTCSS not set)

MD: status command that returns a two digit number
(there's more unsolved MDxx codes).
00 while scanning
01 is returned after a write to a memory channel or in manual mode.
06 mode radio is in after TRUNK key is activated (KEY13, not KEY13H)
07 when in trunk tracking mode.
08 monitoring a held trunk ID
17 after a write through the RFnnnnnnnn command.

MU: Mute AUDIO
Responds A - seems to be default MU setting.
MUA: Un-mutes audio, returns squelch to normal
MUF: Un-mutes audio, opens squelch
MUN: Mutes audio

PMccc: read contents of memory channel ccc. Does not halt scanning. Similar to MAccc function.

PMccc ffffffff; ccc=channel, ffffffff=freq.; Programs channel ccc with freq. Note there is a space (ASCII 32/20 hex/SPACEBAR) between the last c and the first f.

PR: status of PRIORITY scan function.
PRF: sets function off
PRN: sets function on

QU: Receive activity indicator. Used to signal computer program
QUN: causes data port to output + if receiving a signal and - if not.
QUF: turns off QU

RI: responds with status of unknown function - N for on, F for off
RIN: turns unknown function on
RIF: turns unknown function off

RF: responds with freq. in format ffffffff only if this frequency is set by the

RFnnnnnnnn command. If the frequency is already in memory assigned to a channel then the scanner responds NG. Does not work while trunk tracking.

RFnnnnnnnn; nnnnnnnn=freq. (e.g. 470.5875 MHz -> 04705875): Dials up the freq. in the radio (like the VFO mode) but does not program it into channel memory. Scanner replies OK after command.

RM: Reads mode (e.g. NFM, AM, etc.)

SB: responds with bank letter(s)

SB b: goes to/turns on bank b. Multiple letters can be used. Works while scanning. Does not work while trunk tracking.

SG: S-meter reading and frequency (e.g. S014 F04535000). No signal responds S014 for me while a strong NOAA weather station returns S026.

SQ: responds - when squelch is closed and + when open or receiving signal.

SS: responds with END. Meaning unknown.

ST: returns 0000000 - meaning unknown. Produces error while trunk tracking or scanning.

WI: returns Wnnn Fffffffff; nnn=three digit number of unknown significance and Fffffffff where the lower case f is the frequency. Works in MANUAL or SCAN mode (example output: W084 F01541750). This number can change even though the same channel/frequency is held on the radio. The number seems to vary slightly.
==========
KEY functions. Just type KEYxx and carriage return; xx=number below. Acts the same as pressing front panel buttons. KEY functions with H at the end simulate pressing and holding the key.

Note: Some of the KEY functions producing errors are likely because the command is issued out of context. They probably are valid functions.

KEY00: functions SCAN button
KEY01: functions MANUAL button
KEY02 t:For direct entry of trunk ID numbers while trunk tracking:
To enter a trunk ID of 1776, the following sequence would be used:
KEY02 0, KEY02 1, KEY02 7, KEY02 7, KEY02 6, KEY07
For 368: use 0,0,3,6,8
For 25808: use 2,5,8,0,8
maintain a five digit number for these IDs!
KEY03: unknown, responds OK
KEY04: Enters the currently being received trunk ID into memory. See page 45 of the user's manual for details.
KEY05: Toggles PRIORITY (same as PR)
KEY05H: Same as holding down PRIORITY button (assigns channel as PRI channel)
KEY06: Toggles L/O (same as LO)
KEY06H: Same as pressing and holding the L/O button.
While trunk tracking, enters into restoring Single ID mode. See page 42 of the users manual.
KEY07: steps up through channels (will not put radio into manual from scan)
ID hold mode while trunk tracking.
KEY07H: Same as holding down HOLD button
KEY08: steps down through channels
KEY08H: Same as holding down LIMIT button
KEY09: SRC button
KEY10: Turns on WX
KEY11: Toggles DATA skip function
While trunk tracking, shows which bank is being scanned
KEY12: Toggles DELAY (same as DL)

KEY13: Toggles TRUNK button.
KEY13H: Same as holding down TRUNK button (trunking programming mode).
KEY14: Functions DIM button
KEY15: Functions STEP button
KEY16: Toggles AUX (LINE in display) function
KEY17: disconnect radio from computer (activated ALRT/RMT button)
KEY18: bank letters began flashing or ERROR. Perhaps the SEND button?
KEY19: Toggles AUTO button.
KEY20: Toggles CTCSS (same as CT)
KEY20H: Same as holding down CTCSS button (Enter CTCSS search mode)
KEY21 b:Specify a bank to trunk track. Do after a KEY13H
KEY22: Toggles FREQ/CHAN
KEY23: Toggles LOCK

==========
I have been successful in programming the radio by creating a text file and sending it to the scanner. I had to introduce a small delay between characters so the data wouldn't overflow the scanner. Each channel and frequency is on a separate line followed by a carriage return (hex 0D) and line feed (hex 0A).

Update: My error, but my terminal program strips off the line feed (hex 0A). Apparently sending the line feed causes the radio to reject the data. TERMINAL.EXE from Windows 3.X has to have the 'Strip LF' enabled under the 'Following CR:' option. This is accessed by 'Send Text File' from the top memu. In BASIC, I just send a CHR$(13) which is just a carriage return.

For example: (the <cr> is invisible - don't type it. Using a simple text editor, the editor will actually append <cr><lf> where <lf> is a line feed)

PM001 04537250<cr>
PM002 04535000<cr>
PM003 00459400<cr>
etc...
==========
Software Update: No Visual Basic program yet. I will start development on that in the near future.

The MS-DOS application is functioning and ever evolving. The latest version no longer has the trunk ID and assignments hard coded into it. The program now gets its data from a specially formatted text file so anyone can use it.

Here's a snippet of the text file:

000848 SDPD Tac 6
000912 SDPD Tac 7
001008 City Tac 1
001072 City Tac 2
001104 City Tac 3
001296 Southern Dispatch

Below is a screen print of the program:
Note that it intercepts unidentified trunk IDs (where the OK is...), a count of the current trunk (Command 1 has been received once so far),

```
the frequency of the received transmission, and its signal strength.
At the bottom is the file name that contains the data.

--------------------------------------------------------------------------
BC895XLT Scanner TrunkTracking Identification Program (Beta)

Displays count, trunk ID, and assignment.
Press Q to quit.
-------------------------------------------------------------
------------------UNIDENTIFIED TRUNK IDs------------------

Last unidentified Trunk ID : OK @ 00:25:00
-------------------------------------------------------------
------------------------RECEIVING--------------------------

( 1 ) ID:048816 - Command 1
-------------------------------------------------------------
------------------S-METER AND FREQUENCY--------------------

Receiving Frequency: 856.0500 MHz
Signal Strength (0-13): 8
-------------------------------------------------------------
---------------TRUNKING ID & ASSIGNMENT FILE---------------

>d:\bc895xlt\develo~1\sandiego.dat

--------------------------------------------------------------------------

If anybody finds more commands or any other pertinent information let me know.
I'll update this list as I find out more.

Bill Dorsey <dorsey_spamx@engr.sgi.com.spamx> wrote a hundred different
times about a hundred different notions, none of are germane to this thread:

> .... [deleted for brevity]..............

Okay, I've watched you ruminate and lecture for a number of go-arounds
now. It's time to get extremely succinct about matters, even if to the
point of pain. After all....no pain, no gain, eh? I'll begin with a
succinct reminder of the first post to this thread:

brianm1@juno.com inquired thusly:

> I was wondering if anyone knew, besides having a good antenna, is
> there any way to boost a scanner's signals to receive frequencies from a
> futher distance? I have a Radio Shack Pro-46 scanner. I don't know
> much about electronics. Thanks if anyone can help,

Well, I supposed I could help and replied to him, in part, as follows:

BC> A decent antenna is important, all right, but so long as you have an
BC> antenna made for scanners in the first place, there are a couple of
BC> other things that are more important and which do not require any
BC> knowledge of electronics.
BC>
BC>..........[deleted for brevity]...................
BC>
BC> Some people will try to tell you to get a preamplifier to boost
BC> those weak signals. Preamps for scanners are generally a waste of
BC> time and money. For a variety of reasons, they don't work right,
BC> and often cause more reception problems than they correct. Save
BC> your money.

BC> Stick that antenna up higher, and use a good grade of coax feedline.

Well, it wasn't long before you horsed right in there with a whole
boatload of Fourier Analyses and La Place Transforms, amongst other
profound wisdom, with some wild hair notion of altering the status
quo of all scannerdom. Eight profound, esoteric posts in all, none
of which have any outside chance of appealing to the original question.

Not only that.....but your finely articulated and generally accurate
replies/statements mean absolutely nothing to anyone apart from those
who *already know* what's what and what it's for and where it came from.

In a word, you preached to the choir and proffered nothing of useful
substance in the sense that what you did say had meaning ONLY to those

who already knew the score, and otherwise, was leagues over the heads of those who didn't know and who needed to benefit the most from this thread.

You missed the whole concept, not to mention the question. And you made no attempt to address the question, a summary of the answers to which I will elucidate for you (and others) now:

1. The single most influential thing that can be done to a scanner system that monitors 25-1300 MHz is to get the antenna up in the sky as high as is feasible, legal, and safe. The higher, the better.

2. The next most influential thing that can be done to a scanner system that monitors 25-1300 MHz is to use the best possible coaxial cable between the antenna and scanner. Given no budget and space restrictions, sure.....6" hardline would be ideal But that's absurd for our audience, especially the questioner, so the best answer is a call for RG-6 satellite cable with a warning against the use of RG-58 and RG-59 cables, period. And a general warning against the use of RG-8 due to varying quality and the potential for excessive losses due to PL-259/SO-239 connector combinations.

Regardless of your iteration of lab test comparisons between Type N and UHF connectors, the land mobile market is rife with urban legends about weird and costly troubleshooting efforts that zeroed in on the inadvertent use of CHEAP CB-store PL-259 plugs in commercial installations; precisely the kind of connector that is apt to fall into the hands of the neophyte scannist.

This is not to mention the fair difficulty of properly installing PL-259 plugs so as to minimize loss and maximize performance. The neophyte-to-journeyman scannist is not apt to be able to mate PL-259's to RG-8 and maintain an unaltered 25-1300 MHz performance bandwidth of his installation.

Therefore, the greatest results coupled with least chance of error and a lowest cost produces one and only one cable for most scannists: RG-6 satellite cable with gold-plated Type F connectors, and the matching F-to-BNC adapter required for the scanner. This setup is low cost, quick and dirty, and has the highest chances of instant and long term success. Routing and handling is not a problem, either.

It is a good recommendation. Hands down. And for those who sweat the 75-ohm characteristic impedance of RG-6 vs. 50-ohms, it makes not an iota of difference. The VSWR of a 75-ohm to 50-ohm mismatch is 1.5 : 1, for a loss of 4% or 0.17 dB. Truly a hair to split, but in view of the low loss of RG-6, coupled with its ease of use and installation of connectors, the 0.17 dB extra loss is more than offset by the gains.

Except to someone who knows exactly what he wants and what it takes to get it, there is nothing wrong with the blanket recommendation

of RG-6 satellite cable for scanner installations.

3. The third most influential thing that can be done to a scanner system that monitors 25-1300 MHz is to use the best possible (quality) antenna that the budget will permit.

4. If I have $1000 to spend on a VHF-UHF monitoring station, I would spend the majority of it on the antenna system, including tower or mast, feedline, and the antenna itself. I'd buy the scanner with whatever was left. The radio (quality) is the fourth most influential thing that can be done to a scanner system that monitors 25-1300 MHz.

And so does a preamp come in 5th on the list? Or 10th? Considering that questioners like who started this thread almost never thoroughly get down to #4 above, it really is a moot issue about preamps. And what I first said about them remains true and pertinent. But since you are a cut above the masses in essential savvy, I'll just poignantly suggest to you that preamps really are not among the essential considerations of a monitoring post. Most assuredly not until 1-4 above have been duly considered and put into action.

If you want to argue that a barely detectable signal without a preamp can be brought to clarity and full quieting with a preamp, that's fine. But I will argue that an additional 10-ft of antenna height or a grade better coax will do that, too. And not only will it improve that one signal, but it will also improve all other signals in the band. You CAN'T say that of your preamp because (1) it won't be 25-1300 MHz widebanded, and (2) whether it is or isn't that widebanded, it WILL degrade a lot of reception over the band due to desense, overload, intermod, and/or spurious.

A higher antenna and a better grade of coax and/or antenna will NOT cause any degradation whatsoever. They will, however, not only enhance the station at the moment, but they will also lay the groundword to make a preamp work properly when it is time to consider one (if ever).

If you want to argue over where preamps fall in importance to a hobby monitoring post, 5th through 10th, that's your prerogative. I don't have any interest in that argument, frankly. By the time a hobbyist gets to that point of savvy and capability, he's ready for you and your high-brow dissertations. Go get 'im! But I don't think this thread was worthy of your investment of time and composition. You preached to the choir while the congregation wondered what the hell you were going on about.

In a word, you CAN'T (in good conscience) advise entry-level through journeyman hobbyists to put preamps higher than 5th on their list of priorities. If you do, you do not render any semblance of a service to the person nor to the hobby.

Take it or leave it; like it or lump it; but think about it.

862. Loss at the receiver from using the wrong cable

Newsgroup: rec.radio.scanner
Date: 1997-12-09 00:00:00 UTC
From: mweber@t140.aone.net.au
Message-ID: <348a5594.1721679@news.syd.aone.net.au>
Source record: 178087

There has been some discussion of the effect of connecting 50 ohm coax to a 75 ohm input on a reciever, or 75 ohm coax into a 50 ohm input on a receiver.

If you carry out the calculation, the loss from the mismatch isn't much. 50 ohm coax into a 75 ohm receiver involves a loss of approximately .3db. It is a little worse the other way, at about .7db.

I think the point is clear. These are both trivial losses, and would be difficult to measure let alone hear. This is why this is really a non-issue. Many receivers just say Low-Z input, meaning anything in the 50-75 ohm range, because it just doesn't really matter.

Connect either to a A High-Z or 500 ohm input, and that is an entirely different matter.

The 2006 is in great demand because it can be easily modified (at least I think that's why and I own two). However, I can't explain why people can ask for and apparently receive $350 for a used 2006.

Frankly, it ain't worth it. Take, for example, the 2042, which I also own. Right now, it's on sale for $299. That's a super value for a scanner with 1000 channels, 10 search banks, rotary tuning, autostore, etc. etc. etc. Mine has the Opto OS535 and the PROgramit interface in it, which is all of the modification that I have ever wanted. It's by far the best scanner I own.

Hmmm on my Pro 2027 I just use my headphone jack as the output and then I have a custom made patch cable that plugs into the back of my computer and into the scanner.. and there is a headphone jack in there too.. it was not that hard to make.. just 2 connections then a jack for a headphone set. If you have a headphone jack on your scanner I would recomend trying what I did first.

RESTORATION OF CELLULAR FREQUENCIES FOR RADIO SHACK PRO-2027

For those that are interested, the following modification will enable uninterrupted
reception of the 806MHz - 960Mhz spectrum. This modification may
be useful to those who use a scanner in conjunction with down converters for
satellite monitoring.

Be advised that this modification enables portions of the 800 Mhz band that
is illegal to monitor under United States Federal law.

With the advertisements out of the way here's how its done.

1. Unplug unit.

2. Remove bottom panel (4 screws)

3. Locate diode D35 located behind the enter key. This is a
surface mounted component that resembles a tiny black square.

4. Unsolder D35. I prefer to unsolder one leg so that the original
functionality can be restored for resale. This can be done by gently prying up the
component with a pin or tweezers while touching one leg with a
soldering iron. Don't apply too much heat a 15 - 20 watt soldering iron is more than
adequate.

5. Button it up and turn it on. No reset is needed.

Very good point. Mismatches in receiving of a small amount don't really
matter that much. The antennas used for scanning are most times very
broad in frequency. Now if a person should want to scan a narrow band
of freqs. say the 137 Mhz weather sat band he would be well put to
build (or buy) an antenna system for that range. The Imp. of the ant,
cable, and receiver would become somewhat critical for optimum results.
If you check the Imp of say a 'scanner' discone with a bridge the Imp.
runs over a wide range. These antennas have 'hot' spots where the Imp.
is close to 50 ohms. Say for instance the Rat Shack hi dollar one
it makes a fairly good match for the 2 meter and 70 CM ham bands at 50
ohms. Scanners of the 'low cost type' shch as the 2006, 2004 are very
broad in the input department. They make up for mismatches with gain.
just my research talking.. joed

But, why does one want a pre-amp? If not to better enable the listener to hear the signals, then why? I really can't see another reason (except to point to another gadget). And, why can't one hear the signal? Because it's buried. Otherwise, simple audio amplification would enable it to be heard, wouldn't it?

> > > I agree with this to be sure - but you must admit with many hobbyists

Again, a simple audio amp is a better choice here, instead of a pre-amp. An audio amp can be one of many things, including an existing stereo system, or boom box. In this case, much less cost (existing beats buying a pre-amp any day!), the ability to tailer the sound via the bass/treble controls, and far more amplification than a pre-amp can provide.
> --
> Andy Moss
> "Whose woods these are I think I know...."
>
There are lots of people using pre-amps, and figuring they are doing the best they can. My point is that a better antenna will almost always provide better signal than a pre-amp (except in what I call artificial situations, like those places where you can't put up external antennas). Of course, a rotatable antenna is difficult to mount, semi-expensive, and

requires more maintenance than a 'regular' antenna. But, those are the trade-offs that are made for a superior installation.

Pro 26 does not have any breaks in between (except cellulars). 200
channels. Pro 26 picks up 25-30 (which includes CB bands) but Pro
60 doesn't. Pro 26 scans much faster than Pro 60.

Andy,

I did not mention the mod. In fact, I got a message on my answering machine that my scanner was back from repairs. I thought it was fixed!

When I called, the sales person said they found a cell mod and that they refused to work on it for legal reasons.

The fact that I had it repaired about 5 years ago didn't seem to phase the sales person. At that time, they did the repair and also fixed the mod so that the scanner was legal again!

You never know what you'll get at Radio Shack.

Jim

> somewhere only ones with certain serial numbers could be modified?
> If so what serial number should I look for to do the cell mod?
> Thanks
>
>
>
You can determine if a PRO-43 scanner is modifiable by looking at the FCC id # on the back of the radio. If the number does not end with A, (for instance AA020-300) it IS modifiable. If the number does end with A, (for instance AA020-300A) it is NOT modifiable.

Mike,
I see from Deja News that you posted this on the 6th

Subject: BC9000 Receive
From: watnny@aol.com (WatnNY)
Date: 1997/12/06
Newsgroups: rec.radio.scanner

Does anyone know how to "turn up" the receive on this unit ??? I
mustbe one of
the unlucky ones who got a deaf unit. I'm using it with a Radio Shack
Discone
mounted 30 feet in the air -- and I don't think the reception is as
good as a
Radio Shack PRO-2028 !!!

Any help would be greatly appreciated.

Mike
Watertown, NY

First off, what makes you think it is not receiving well? How many
comparisons have you made and at what frequencies? The first thing
I would suspect is the co-ax. What type are you using?

Is this a new unit or did you buy it used/refurbished? There is
always a chance it is not aligned properly but I doubt this
would be across it's entire receive coverage.

Feel free to e-mail me at the Reply To address of this posting.

Watertown, huh? What a frozen wasteland! ;-) I grew up outside Buffalo
myself.

891. Re: Pro-60 Versus Pro-26

Newsgroup: rec.radio.scanner
Date: 1997-12-09 00:00:00 UTC
From: Tom.Walker@f211.n1000.z52.warpgate.com
Message-ID: <3f4_9712090700@warpgate.com>
Source record: 178116

AI> I was just wondering which is a better deal:a Pro-60 at $190 or a Pro-26
AI> at $250. Which scanner is better and why?

They both are Triple Conversion. The PRO-26 is a Ful coverage reciever
catching basicly everything between 25 Mhz to 1300 Mhz. Less fo course the
Cell bands and some very small slivers in other areas. The PRO-60 covers all
the general interst typical Scanning frequencies between 30 Mhz to 960 Mhz
less Cell, TV Channels, and the Standard FM band. The PRO-26 hgas the addition
of a Quick Weather Band button and has Higher scanning speeds. 50 Channels per
second vs 25 for the PRO-60. And the Hyper search runs at 100/300 Channels per
second vs 50 fro the PRO-60
As yto which one is for YOU? That is Your Decision and depends on what you
are intersted in. I have a PRO-60 and it is all I need. But if you are
interested in Sniffing out freequencies the higher Banbd Search speeds would
be an advantage for the PRO-26.

Source record: 178154

I'm looking for an all band antenna that has good SWR centers. The Austin Ferret is centered at 40, 100, 122, 146, 155, 315, 465, 865, and 1280.

This covers damn near anything I'd ask for in an antenna. I'm using a radio shack discone (un-informed decision but it does work really well on UHF), but need more.

If anyone has had any experience with them or suggestions or an equivalent type of set-up I would appreciate anything.

Thanks for your time!

Please email any response since I really want to know and I don't want it to get lost 'out there' on the net.

I found some mods on the net for the Radio Schack Pro 60 200 channel scanner but the page is in some weird form and I can't read it. Does anyone know the modifications for the RS Pro 60? I found something about a light switch and doubling your channels. I would be appreciative of any info at all; like internet addresses and what not. Thanks again. Collins

If you're wondering what some of the scanners look like, I've posted the following models (from the Radio Shack '96 catalog) to alt.binaries.pictures.radio.
PRO-2033, PRO-2034, PRO-2037, PRO-2039, PRO-508 (a model I recently bought). C.Crane's web page has great pictures of the Sangean and Lowe models they carry. Would also like to see the ICOM models discussed here. Would also like pictures of some of the "classics".

902. Trunk Manager for Windows Beta

Newsgroup: rec.radio.scanner
Date: 1997-12-09 00:00:00 UTC
From: Ben Saladino <bicycles@fastlane.net>
Message-ID: <01bd044c$10f10b20$84a637cf@bsalad.fastlane.net>
Source record: 178158

Hi All,

I've just released Trunk Manager for Windows to public beta on my website and would like your input. If you are interested, please visit http://www.interplaza.com/bensware/tm.htm

What is Trunk Manager for Windows?

Trunk Manager is a database program designed specifically for storing, sorting, searching, and printing information on trunked radio systems. Trunk Manager stores most of its information in talkgroup files composed of channels representing radio talkgroups or channels.

Features
•Save your data so you can share it on the web as an HTML document! Check out my own web page for an example.
http://www.interplaza.com/scandfw/ttdfw.htm
•Print to Printer including Print Preview
•Lots of customization options on above HTML and Printing.
•Filters to View data for particular Systems, Users, and/or Classes
•Custom Index Option for sorting the way you like.
•Custom Filter Option for viewing only what you are interested in.
•Single Record/Multi Record or Table of Records Views
•System, User, and Class Lookup databases for fields where you are likely to be entering the same data over and over.
•Size Code Helper - Converts Type II IDs to Type I Fleet-Subfleets for Size Codes 1 through 12. Helps nail down those elusive size codes.
•Radio Manager for Windows uses the files you create in Trunk Manager for look-ups when in the Uniden Bearcat BC895XLT Virtual Key Pad window. Check out Radio Manager for details.
•Save your data as a TRUNKER.EXE 3.X *GRP.TXT File for use with that cool program. You'll be able to see channel names along side the talkgroup IDs the program displays.
•Import data from text files including TRUNKER.EXE 3.X *GRP.TXT files and UFDBF files for frequencies.
•Hexadecimal/Decimal Conversion Window.

Thanks,
Ben Saladino, KC5IRJ

Well, you know....the classic "come-on". Offer a freebie and
then dazzle 'em with fancy footwork to help separate them from
their cash.

Think about it. Would YOU, even in the goodness of your
heart, offer an indeterminant number of people any sort of
freebie that requires expenditure of time, effort, and resources?

Of course not.

But this guy did. Either he was on a troll or else he wasn't
overly cognitive of the ramifications of his offer.

That wouldn't be very bright. Many adjustments are for specific
bands. So if he's tuned to NOAA and tweaks an 800 MHz capacitor,
then what?

It's best he identify the capacitor first, and get some input
on what it's for and what it does and the conditions or results
for which it is to be adjusted.

If nothing is forthcoming, then an experimental tweak while
listing to a known quality and strength station might be in
order....but it's not something to do right off.

908. Bearcat 350a scan delay

Newsgroup: rec.radio.scanner
Date: 1997-12-09 00:00:00 UTC
From: CastleCain@person.net
Message-ID: <348cade5.2937762@News.vnet.net>
Source record: 178164

I have a Bearcat 350a which is almost useless to me with the built in scan delay. The service I want to monitor is duplex and requires no delay. Is there someone who has sucessfully removed the delay from a Bearcat 350a, or modified it to be shorter. A one second delay is what it has with no option to turn if off, which is stupid from a design standpoint.
Thanks, Rod

914. 235xlt antenna...

Newsgroup: rec.radio.scanner
Date: 1997-12-10 00:00:00 UTC
From: John <XX629371@att.net>
Message-ID: <66ms9g$pmj@bgtnsc02.worldnet.att.net>
Source record: 177920

Hi all,

I know I've seen this topic covered in the newsgroup, but for some reason, I can't find the messages now, so bear with me...

I recently purchased the 235, and while happy with the radio, the rubber duck that comes with it is "less than ideal".

What is a good replacement antenna for this radio? I believe someone said a Radio Shack antenna works really well on the radio, but I can't remember the model number or name.

Any help is appreciated - here or Email.

Thanks.

John

Snipped rant from Cheek to preserve bandwidth
>It really can't be any other way, if you think about it....

I have listened to this Mackey vs. Cheek vs. ?? crap for well over a year now (I was formerly with other isp's under the nick "Radioman"). Up until I saw this post I have always been in the Cheek corner as we had mutual friends (Lentz). Bill, what has happened to you that makes you so hateful toward people? Were you abused as a child? You could just say to the guy that you never got his mail and maybe in the future you will look into the 895 scanner. Damn simple, to the point, and NO attitude. Lest you think that YOU are the only person who can hack mods, there is another way.... As for the flying files on the net, that is exactly what the "Infomation Superhighway" is supposed to be for, information exchange. I don't think your whining about your kids having to eat is a viable excuse for slamming someone either. After years of hunting freqs in Houston, some of my discoveries ended up being published in Police call and you don't hear me bitching. You made alot of money from your previous books and kits so don't tell me that your kids go hungry. Why don't you sell some of your gear if they are so deprived. Get a life Bill and learn some manners.

Emoney250 <emoney250@aol.com> wrote:
>I can't seem to scan these new radios. (I have a Pro-90)..Any advice?

I don't think you will be able to. I was an engineer at Nextel when they were first putting together the digital stuff. The security is pretty impressive against cloners, too. A Scout won't pick up the transmission frequency, either, and even if you knew the frequency, it's digital.

The phones have a 32-bit imei (ENS-like) serial-type number, that can be switch on or off centrally in seconds. Unlike a cell phone, it can generate a new random "key" any time the users wants to (with coordination of someone in customer support or something) making cloning nearly impossible.

The audio is encrypted using a fairly simple method, but good 'nuff for the most part. Kinda like car alarms -- no matter how much you spend, a pro with deep pockets can always snatch it.

The portable handheld Nextel phones we were using were 1-watt handhelds, unlike the 1/4 or 1/8 watt cellular phones that you see every day. I would get email, paging, voice mail, etc on that phone. Very nice. Much more simple to use than a cell phone for calling features like no-answer-transfer and the like. The Nextel phone has plain english menus to do stuff like that, as opposed to the *71+number+send crap.

Oops, you're correct. It's only the decoder requirement which
lapses... Although it might be better to hack up a 600 baud FSK
demodulator, possibly with a XR-2211 chip, and feed it into a
software based program runing on a spare computer (like an old Vic20
or C=64) or into a TSR on your regular computer... I not really
secure in the knowledge that a station would follow the required
procedures of preceeding an EAS message with the two-tone... I've
heard enough of them F*ck up when it was the required method (before
EAS).

[from www.fcc.gov]
==========

11.11 The Emergency Alert System (EAS).

1/ Two-tone signal used only to provide audio alert to audience
before EAS emergency messages and required monthly test.
2/ On this date, subject cable systems shall provide: (1) a

video message on all channels or other alerting techniques to
hearing
impaired and deaf subscribers, (2) an audio message and video
interruption on all channels, and (3) a video message on at
least one channel to all subscribers.
[...]

==========

BTW, for those wanting to try a hack at software decoding, 11.31 (47CFR)
gives the protocol of the EAS message:

==========

11.31 EAS protocol.

(a) The EAS uses a four part message for an emergency
activation of the EAS. The four parts are; Preamble and EAS
HeaderCodes, audio Attention Signal, message, and, Preamble and
EAS End Of Message Codes.
(1) The Preamble and EAS Codes must use Audio Frequency
Shift Keying at a rate of 520.83 bits per second to transmit the
codes. Mark frequency is 2083.3 Hz and space frequency is 1562.5
Hz. Mark and space time must be 1.92 milliseconds. Characters
are ASCII seven bit characters as defined in ANSI X3.4-1977
ending with an eighth null bit (either 1 or 0) to constitute a
full eight-bit byte.
(2) The Attention Signal must be made up of the
fundamental frequencies of 853 and 960 Hz. The two tones must be
transmitted simultaneously. The Attention Signal must be
transmitted after the EAS header codes.
(3) The message may be audio, video or text depending on
the transmission medium.
(b) The ASCII dash and plus symbols are required and may
not be used for any other purpose. Unused characters must be
ASCII space characters. FM or TV call signs must use a backslash
ASCII character number 47 (/) in lieu of a dash.
(c) The EAS protocol, including any codes, must not be
amended, extended or abridged without FCC authorization. The EAS
protocol and message format are specified in the following
representation. Examples are also provided in the EAS Operating
Handbook.

[PREAMBLE]ZCZC-ORG-EEE-PSSCCC+TTTT-JJJHHMM-LLLLLLLL-

T>You had bleed-over and intermod problems even with the tone board
T>activated? Doesn't sound right. Are you IN a major city? Was
T>the bleed over from an adjacent radio that was receiving in the same
T>band as the channel being bled into?

Here is the problem that I had, and the reason that I think it is a
defect that can be fixed.

When scanning with the tone board activated, the radio will only stop on
a frequency with the correct tone. During the transmission, the radio
works fine. After the transmission, the radio acts as if the tone was
deactivated AND the squelch opened wide. It is then when I receive all
of the intermod and other junk. This lasts for about 2-3 seconds after
which the radio quiets and resumes scanning. So, it's not really regular
intermod, if there is such a thing, it seems related to the CTCSS-
squelch function. I called RELM and spoke to one of the service people.
He said it might be a CPU related problem.

As I said in a previous post, the HS-200 is so good, it's hard to
believe that the MS-200 wasn't meant to be the same way.

>THANK'S
>Peter Davidsson SWEDEN
>

So you live in Sweden. I really have no idea how your government uses the radio spectrum so I cannot give any specific details. What you probably should buy is a scanner with a wide frequency coverage with no gaps, and that has selectable modes and step sizes. In the case of handhelds, there are some models you might want to look at further: Radio Shack Pro-26, Commtel 216, AOR 8000, and the Yupiteru MVT-9000. For these last two radios I mentioned you can find reviews on Richard Well's website at <http://www.qsl.net/n2mca/RADIO.HTM>. For base models, the only ones I am currently aware that have truly no gaps (including the 550-760 MHz band, what we use in the United States as T.V. channels) are the AOR 3000A, Icom R100, AOR 5000 + 3, and the Icom R8500. Some more information on all of these models can be found on Javiation's website at <http://www.demon.co.uk/javiation/home.html>. Good luck!

I was wondering what you people think would be an alternative to the Pro-62. The 62 doesn't receive in the railroad band well at all, other than that, I like it. But, I really want the railroad band, so, there you have it. Any suggestions that won't break my wallet? TIA.

Oh really? I don't see your name anywhere here.....

> as we had mutual friends (Lentz).

Him? You're kidding. He never had any use for me.
And his cousin never did either.

> Bill, what has happened to you that makes you so hateful toward
> people?

Ohhhhhhhhhhhhhhh gawwwwwwwwwd.......here we goooooooo again.
<Muttering a prayer.......>

> Were you abused as a child?

Ummmmmm......sort of. Why?

> You could just say to the guy that you never got his mail and
> maybe in the future you will look into the 895 scanner.

Why would I do that? That's goody-two-shoe shit and not
remotely connected to the truth. Besides, the guy never
left open the possibility that I didn't get his mail. Here's
what he said:

-> I E_Mailed you a few weeks ago, knowing you
-> are a busy man I kind of blew it off that you did
-> not return.

Nice of him to "blow it off" but the assumption is clearly
there that I received it. Well, I felt like telling the truth
instead of mincing words and glossing it over. The fact is,
I reply to most all e-mail, including shitbirds for a while.
What the hell's the matter with THAT?

As for the rest of my reply...which was TO HIM; not you; no
hatefulness to it at all; just the hard core truth after thousands

of similar inquiries that go nowhere. People have the
WRONG idea about mods and hacks. Who is going to set
them straight? You? Oh, I get it now....you want ME
to set 'em straight YOUR way. Get outa my life, dude.

On the other hand, such truths HAVE been inspirational
to the more serious hackers who can see beyond the end
of their keyboards..... Some people take things one
way and some take 'em another. I'm not going to mince
words and spew fluff and gooshy bubbles and perpetrate
the deception, that's for sure. And I don't give a hang
if you like it or not. I'll give a hang when you pay
me; but not as long as it's free. And the truth that
got laid on your head and shoulders is free. Tough.

> Damn simple, to the point, and NO attitude. Lest you think that YOU are the
> only person who can hack mods, there is another way....

Well, I wish there *were* others. Are there? Who? Inspire
them, then. Put 'em up in the lab and commission 'em to
whup it out. I wish there were a LOT of ways, if the truth
be known. Your ranting invectives don't make the truth, however.
You just don't like it when you see it. Tough, pal.

Pack sand if you don't like it.

> As for the flying files
> on the net, that is exactly what the "Infomation Superhighway" is supposed to
> be for, information exchange.

Bullshit. Not exactly, anyway. Well, information, yeah. Not
full feature books, movies, music, and other arts and crafts.
Not slavery. Not servitude. But information, yes.

Like..ferinstance, to restore cellular in the PRO-2006, pop
the top cover; peek in behind the keyboard and clip the two
diodes that stand on end just behind the #3 key. You get
full-blown cellular and a free speed boost for the 2 mins of work.

There. That's something suitable for flying around the Net.
Lots of things similar to that are equally suitable. But a
lot of things aren't suitable....especially for grubby,
ungrateful, bony, booger-pickin fingers like yours, pal.

> I don't think your whining about your kids having
> to eat is a viable excuse for slamming someone either.

Maybe you should hire someone to do your thinking for you?

I don't see YOU working 12-18 hours a day for the betterment
of the radio scene. Or for the betterment of anything. for
that matter....certainly not for free, *if* you work at all....
And THAT is a big *if*........

> After years of hunting freqs in Houston, some of my
> discoveries ended up being published in Police call
> and you don't hear me bitching.

Aw balderdash! Anyone can discover a frequency, and anyone
can look the damn thing up in the FCC Allocation Tables and
in the license databases. No matter....finding freqs is one
thing that's ideally suited for sharing around the Net. You
are a gentleman and a scholar for not bitching about that.

On the other hand, if Police Call makes a living off the
fruits of your free labor, then you are plumb dumb. Or nuts.

Now tell me about your living and how you'd react if
your employer mentioned you'd have to work for free two
days a week for the privilege of being there. Yeah, ri--ght.

> You made alot of money from your previous books and kits

Oh really now? Do tell me just how much I made, then.
Stick it out, Jerkov, tell me *all* about it. You know
so much....spit it out. Don't be afraid now....do it!

And then I'll take you out and show you where the cow
ate the cabbage and where the bear shit in the buckwheat.

> so don't tell me that your kids go hungry.

How's about if I tell you to urinate up a rope and
nurse the wet end. instead? Would you like that better?

> Why don't you sell some of your gear if they are so
> deprived. Get a life Bill and learn some manners.

Geezus.....who goosed you? You been in the Unemployment
lines too long and got yourself all accustomed to the dole?

Manners? Life? Ha ha ha ha ha ha..... you gotta be
pullin' me leg.

Tell me I should follow your glowing example.

Take a hike, Spike. And eat my shorts whilst you're at it.

Bill....

nice to see you have recovered from your
ennui... I cannot stop laughing at your
wit and wisdom...it's baudacious.

Keep me laughing Bill....you are one of a
bunch. The humor you provide is food to my
mind-stem.. I hunger for more food as you
provide it.

keep the banal happy with your jibe-truths.
make the sleep glad to be awoken by your
verbosities....

Cheek-guy...humah is you. Just that so few
here can see or smell it. What is your secret
for hiding it so swell?

I am in hysterics over what you raped this guy's
mind over....pure bill cheek "take this pill and stuff
it in a safe place"...ism.

There are a few who understand what he puts forth that
is so funny and yet so "common". The commonness of
those who tell you to "get it straight".

Seems you put them straight, straight to "the room of
1000 confusions"....

Welcome back to the present. Keep it up.

fruckin funny stuff u write brah...we lik it dat way.

bill conduit
etc.

Thanks for all the responses to my post! As to which trimmer I turned,
the only identification that I have to go by is the screen printing on
the PC board. It looked to be marked as C4. The trimmer is on the main
or "mother" board, near center. Both boards that attach to the main
board have a hole to allow adjustment with all boards in place. Why do
you think C4 is not correct? I can disassemble the boards and again
check the marking, if I need to.
Please advise.

Bryan,

I listen to the arcraft en route (airline "company") frequencies,
ACARS, military a/c and railroad frequencies. the "company" freq's
(a28.825 - 132.000, AM mode) are VERY interesting at times.

Actually the line between modifiable and nonmodifiable Pro-43 is not distinct. By what I have read the 43 I have should not be modifiable. It has a date code of 4A4, an A in the serial number, and an A at the end of the FCC ID number. Yet it is modified, was that way when I bought it second hand. The only way I have ever seen to tell for sure if a 43 is modifiable is to take it apart and look and the main IC board.

the above is my uninformed 2 cents worth.

938. Re: Why is the PRO-2006 so in demand?

I've read you say that before. What are your reasons for choosing the 2004 over the 5 or 6? I'm curious because I have a 2004. But have not had any experence with the other two. I know the metal case is a plus.

I came into this hobby late and lucked a 2004 that had been stored and had very little use.

941. Universal Radio: They don't wanna talk about it...

Newsgroup: rec.radio.scanner
Date: 1997-12-10 00:00:00 UTC
From: Michael Harpe <mike@ple-technology.com>
Message-ID: <348F6CEE.33E1@ple-technology.com>
Source record: 177947

I visited Universal Radio's nice digs outside Columbus the Saturday after Thanksgiving. Business had taken me to Columbus and I decided to go by on my way out of town.

It's a nice place. The chick in the short skirt from the catalogs really works there. I had seen most of the guys before at various hamfests. The place is well-stocked, clean and has reasonable prices.

I asked a couple of folks working the counter about their rumored visit from law enforcement and their new policy about only selling their nifty decoder boxes to "law enforcement".

Universal doesn't wanna talk about it. I literally got a blank stare that drifted toward hostile. They brightened up when I bought a Garmin GPS III but still no comment.

I guess this is how the government is going to do it. No business is going to risk getting it's door kicked, computers confiscated, frightened office personnel, etc. just to sell nifty decoder boxes. Good old fashioned intimidation still works here just like it does in the schoolyard.

Oh well, there's always Canada. A good friend of mine brought an R-9000, fresh in the box, back from Canada the other day. No problem at all. Drove it right across the border.

I'm glad I bought my M-450. I'll sell it for $1000. Any takers?

That's OK. The M-450 is like a Beanie Baby. Someday i'll sell it for $2000. Is that wrong?

Thanks, Universal, for caving in completely. You should be ashamed of yourselves. Why not just close the doors and become one of those "private security" outfits selling bugging devices to cops? All you need is a guy on your staff that used to be a cop. Think about it. At least it would be more honest.

I have an original PRO2026 (continuous 800/900) that I need some minor work done on. Specifically I at least need the LCD replaced and someone with electronic know-how (not me) to give it a good look to make sure it is okay. For reasons I would rather not get into, said scanner met the pavement at a high velocity over two years ago but still works. I rarely use it so turnaround time is no big deal. If someone can recommend a place/person to work on it whom can be TRUSTED both in quality and price (decent, not ripoff) I would appreciate knowing. I live in Massachusetts and could bring it to a shop here or ship it out to a reputable person. Thanks in advance.

Great features!

Terrible Receiver!

If only Relm had designed a better front end I would love the radio. I installed three in my base setup and do to all the intermode, blead over and junk it received I had to remove them the first night. Then put them in the mobile and no improvement. If you live 50 miles from the nearest tower this radio might work for you. Otherwise stick with one of the other brands available.

As far as I know, there is no scanner that can pick demodulate digital signals. The $10,000 "scanner" they are referring you to is one of their radios that is able to search. However, since it is under the digital system, they can easily disable the radio if they wanted too. And then you'll have a $10,000 paperweight. My advice is to scan their cellular telephone range to see if you can get any of their communications. Don't even think about trying to steal one of these radios because because they can disable it quite easily. Start the protesting now, but it probably won't do you much good.

Dean,

You had bleed-over and intermod problems even with the tone board activated? Doesn't sound right. Are you IN a major city? Was the bleed over from an adjacent radio that was receiving in the same band as the channel being bled into?

There is a CE-232 Script file area on my FTP site at:

ftp://204.210.9.236/pub/intrface/scripts

And there are a couple of helpful text files there on script writing.
Files can always be uploaded to:

ftp://204.210.9.236/pub/incoming

If there is any interest, I'll be happy to expand this site.

The BC-860XLT will receive cellular as images above 900 MHZ, but the channel steps are not 30 KHZ. However, it still does a fairly good job, according to what I have been told.

It does have some intermod problems. That is, I have seen two different scanners: one was absoultely eaten up with intermod while its replacement was much better, but still not as good as you might like. I wouldn't recommend it for a large metro-area with lots of pager transmitters, etc. However, it is also possible that anything else that you get will have the same problems!!

Regards,

Bill

While that MAY work in some cases, there is a problem
with depending on the headphone or even TAPE REC jacks
for quality signals.

Between the NFM Discriminator's baseband audio output
and the headphone jack (or speaker), there are a number
of "filters" that serve to shape the bandwidth to more
or less the universally recognized voice band of
300 Hz to 3000 Hz. Signals above and below those
limits tend to be attentuated, thanks to the filtering.

Data, especially at 9600-bps and faster requires lots
more bandwidth than what is available at the headphone
jack, and usually the TAPE REC jack, as well.

It is just plain wise to make your data tap connection
straight to the baseband audio pin via a shielded cable
and a 2,2-uF tantalum coupling capacitor.

You may be misled by success at decoding 300-2400 bps
data streams. You will not be successful at 4800 bps
and faster, though. At least, you can't count on it.

This may sound dumb but...when I got my 2004(used) I was still pretty new. I thought the sensitivity was bad too so I sent it in for repair(not to RS) and $60 later it came out the same. Then after checking out www.qsl.net/n2mca/RADIO.HTM (which is the best site on the web), I figured out to move the switch in the back:

ATT 10db -> 0db

What an idiot! At least it got tune up.

> vicinity. Above that height, returns are greatly diminished.

That is patently ignorant. The only semblance of truth of what
you said applies to local signals. Once a signal reaches full
quieting, then granted, additional increases of antenna height do
nothing for THAT signal. But it sure does help hundreds of other
signals out there, that *were* below or at the noise floor. Are
you dense or what?

You conveniently or nesciently overlooked the effect on more distant
or weaker signals where antenna height *always* has a profound effect.

For any given station, an increase of the antenna height *always*
results in (1) increased range by virtue of increased "line of sight";
and (2) by decreasing the Plane Earth loss of both local and distant
signals. Plane Earth Loss is a function of Tx and Rx antenna heights,
as well as the distance between them. (Ref: K. Bullington, 1947)

> period.

No. Only RG-8 from reliable (read Mil-Spec) manufacturers can be
relied on to have specs that beat RG-6. There are many grades of RG-8,
and the kind sold at CB stores and such is not what you can call reliable.
Maybe it's good stuff; maybe not. It's not wise for newbies to take
that kind of chance.

> instead of spreading Fear, Uncertainty, and Doubt about them?

If the issue came up, sure. If asked, sure. But I don't have the time
to write a 90-page dissertation for every 12-word question that pops up.
What's more, that questioner doesn't WANT any more than a basic paragraph
that he can sink his teeth into. If he wanted more, he could always
turn to the Radio Amateur's Handbook.

By the time a hobbyist reaches your exalted, pompous, sanctimonious
level, he will be eminently capable of picking his own cables and
connectors.

> >
> Here you say that 0.17 dB of loss is "truly a hair to split," yet
> earlier you were complaining about how lossy PL-259 connectors are
> when in truth they are of the same order of magnitude.

No. I am not talking about Amphenol silver-plated PL-259's with
TFE dielectrics. I'm talking about cheap brand-X PL-259's that
can be extremely lossy, on the order of several dB..... But the
hobbyist has no realistic way to sidetrack himself into an array
of exhaustive I/O tests. It is simply better and very sound advice
to the entry-level and journeyman hobbyist to steer clear of RG-8
and PL-259 conbinations for use at UHF. (I won't argue the issues
for VHF and below.....) But then most scannists aren't limited
to VHF and below.

> > Except to someone who knows exactly what he wants and what it takes

<Giggle> Well, since advice is free, I guess "they" can follow
whatever advice "they" want. I'd still like to see YOU taking
an active role in answering the newbies' questions around here.

But of course, you have better things to do, right? (Like picking
on poor little me?) Heh heh heh heh.........

> Once your antenna is a bit above the height of average
> terrain in your area, raising it any further is going to have
> a very small effect on weak signal strength.

That is an utterly nescient statement....typical of a half-educated
CB'er that quit school after the 4th grade to go drive 18-wheelers.

> Oh, and (1) you can buy preamps that not only work from .005 GHz
> to 2 GHz, but also have flat response in that range.

The newbie and journeyman scannist can't. Not without an exhaustive
search....and a subsequent risk of waste of money. What....are you
recommending the GRE Super Preamp or something?

Or one of Radio Schloque's CATV preamps? HA ha ha ha ha ah aaarrrgh.

> I've already cited sources in an earlier article.

Cite 'em again. Keep on citing them. Why not offer some for sale
yourself? Show the world how to hear everything there is to hear
on their Uniden Yuppie Snazzle Sizzler ScanCats. Do it, man!

> By the way, I must have missed the articles in which you were
> selected to be the voice of the congregation.

Yes, you must have missed some. Sounds like a personal problem, pal.

> Perhaps you could point them out to me?

Perhaps you could do your own research.

> Or did God himself select you?

Why don't you ASK him and find out? You wouldn't believe me
if I told you anyway, so I won't waste my keystrokes. You ask 'im.

> Meanwhile, for those readers that are interested in scanning with
> a foundation in science and fact rather than Cheek's religion,
> perhaps it is time to start a rec.radio.scanner.technical group.

Why don't you start one and see how many participate. I dare you.
You don't have a hair in your bald arse if you don't..........

C'mon, big fella.....belly up to the bar and whup it out.
Let's see what you're made out of. The Good Lord made some
men out of flesh and blood and others out of shit. Let's
see which one you are.

I am sure we ALL could profit from your vast reservoir of technical
wisdom and lore, so I'll be watching for rec.radio.scanner.technical
to appear in my newsgroup queue.

No balls, no glory, Ignats. Load 'em up in a wheelbarrow and
let's get Mister Fantastic Bill Dorsey the accolades, fame,
and fortune that he so well deserves.

You wanna ride a big wave? Well grab your surfboard and
let's go, Slick!

However....in advance, I am going to wager that you are some
kind of a hybrid cross betwixt a 3-legged weasel and a
pincherless crawfish. So my advice is to watch out for what
you might back into..... Slick.

/B

Sure. Try the one that came with the scanner. Or stick a
coathanger in it. Or a piece of wire. Any indoor antenna
is "great".

Or....maybe buy Radio Shack's magnet mount scanner antenna
and glum it to the top of your refrigerator. You probably
can't do much better than that. And it won't be good.....

Indoor antennas just don't classify ....

That is a trifle on the steep side, I'll grant ya.

> Frankly, it ain't worth it.

Well, I dunno......at what point is it worth it? If $300, then
$50 difference isn't a matter of night and day. And the PRO-2006
definitely will receive continuously between 760-1300 MHz. That
is a bit of a plus, for sure.

> Take, for example, the 2042, which I also own.
> Right now, it's on sale for $299. That's a super value for a scanner with 1000
> channels, 10 search banks, rotary tuning, autostore, etc. etc. etc.

Yes, that is a good deal, too. Especially considering that
the PRO-2042 really is a close-clone of the PRO-2006 in its
electronic design. Not bad. Not bad at all.

> Mine has the Opto OS535 and the PROgramit interface in it, which
> is all of the modification that I have ever wanted. It's by far
> the best scanner I own.

Well, you are talking *personal* preferences now. And those
preferences certainly set you back a few more hundred on top
of the prices of the 2042's. I'm not implying anything there;
just exemplifying your use of the pronoun, "I". Within that
subset of data, there is no disagreement.

OTOH, the PRO-2006 certainly is modifiable and it can do a lot;
just like the 2042. However, the 2042 has that nasty aspect of
its evolutionary design where it picks up image frequencies in
the 1100 MHz band and....for that matter, other bands, too? Who
knows for sure? But the 2006 is not susceptible to that kind
of interference.

So....hey....there are pluses and minuses everywhere. Me, I
like anchovies and habanero peppers on my pizza, but I'll grant
that you might not be up to 'em.

:-)

I wish I could help, but I have no knowledge of the scenario you
told above. I can say that the older PRO-43 (not the newer one)
was capable of a hack to take it down to 8 MHz or so. I haven't
heard the same of the PRO-26, though, but even if it were true,
I can't imagine that being the basis for the recall.

A side door into cellular, maybe. The law gets involved there,
you see.

But frankly, I just don't know.

I once got an estimate from Radio Shack Repair to fix a Radio Shack Pro-43 scanner that appeared dead.

They had the scanner for a week, then quoted $100 (and three weeks).

I found a posting about resetting the microprocessor RIGHT HERE on the newsgroup and "fixed" it myself for free in 30 seconds.

If Radio Shack doesn't know its own products, I certainly wouldn't even consider having them look at some other manufactrurer's device!

Just a personal observation that could save you grief...

Steve

Not only that, Jim, but there is no wideband receiver nor wideband antenna under the sun that can exhibit a "flat" 50 ohm input impedance across their performance bandwidth,

Instead, that impedance curve will be "bumpy", rising to 75 ohms or more and dipping to 25 ohms or less in places across the band.

You're right....it just doesn't matter.

I have had the most pleasant experience ordering parts for my AR-2002
AOR scanner.

I contacted: Simon at: info@aor.co.uk They are located at:
4E East Mill
Bridgefoot, Belper,
Derbyshire DE56 2UA England
+44-1773-880788 - Int'l

The courtesy that was extended by these people was outstanding. They
took my parts order via e-mail and suggested I call my credit card info.
in on the telephone for security reasons.

I thank them very much for their customer service and courtesy.

> not return.

Busy or not, I reply to all e-mail. I never intentionally
ignore any....unless from a shitbird. And even then, I'll
usually hose 'em back a time or two before putting them
on my Shit List (kill file).

Checking my queue, I see nothing from you, though. You're
a good guy....but I never got your e-mail.

> You say that dozens are possible.
> Can you enlighten those of us that are interested
> in the BC895.

No, because this is a matter of our imaginations. I don't
own a BC-895XLT and so my imagination on it would be rather
dull. That's one point. Another is that while dozens of
hack are possible, I sure don't have the time to sit down
and let my kids go hungry while I crank out new and wonderous
things for it. But the biggest thing of all is that no one
else does that either.

Yes, dozens of "mods" are possible. Beyond that, I can't
answer more in absense of specific questions. When a
specific comes along, then I'll do my best, consistent
with available time and resources.

In the alternative, I do from time to time, post mods of
a generic nature that can be applied to most scanners
with a little ingenuity, initiative, and work. Often,
I'll develop a mod for one scanner, and it has the
capability to work for many more. If it doesn't take a
lot of hi-res graphics and hours and hours of writing,
I'll post it. Those are the exceptions, however.

> One idea I have been pondering,
> is there a way to make the AM / FM switchable
> manualy,

Probably. But I don't have a service manual for this scanner
and am not about to shell out for one when I don't need it.
If you can provide me with a legible, clear copy or even a loan
of the original, then I can answer that question to a more

accurate degree.

> can a BFO be Installed to monitor 2 mt sideband.

Likewise, see above.

> I have a BC895 and am shure
> that the posibilities of making a good radio, into
> a great radio are there.

I'm sure so, too. But I don't have the time and resources
to plop down and spend weeks and months just "doing it".
A man and his kids have to eat...among other things that
require the better part of a 24-hr day just to get by.

My point is simple. Yes, many things are possible. But
those possibilities don't exist in the top of my mind,
nor all laid out nice and neat in a batch of free text
files strewn across the Internet. They're just possibilities.

And to make them REAL requires several steps....most of
go unseen by the casual observer. Ferinstance, I have
had a PRO-64 for a week now....and have been writing
up things about it....and haven't even cracked the case
yet. It will take MONTHS to extract the majority of
exiting possibilities for this rig....and to write them
up, complete with photos, diagrams, and clear steps of
procedure.

It ain't something that just comes down like rain out
of the sky for the asking of "any mods?". It's really
kind of complicated.....and to get the ball rolling on
some "Brand X" scanner, there really has to be a two-way
interaction between the developers and the users. Each
side has responsibilities and duties.

Yours, if you are all that hot to trot, is to acquire
the service manual and let me borrow it or have a
copy, and then we go from there.....based on specific
questions, of course.

On another slant....what with over 800 scanners ever made
and floating around "out there", there is no way under the
sun that I can cover or even know much about them all.
Soooooo, what I do is this.....

I first apply my own personal interests. I get a scanner
and milk it for all it's worth - a process than *can* take
years, as in the case of the PRO-2004/5/6, PRO-2035/2042,
and PRO-34/37/39/43/64. I can't afford to buy everything
that comes out, nor to take the time to engineer a book
of hacks for everything that comes out.

Secondly, after my own interests are fed...and I confine
my focus generally to the better scanners....I will take
an interest in what the market will support. So if the
BC-895XLT happens to get a lot of market attention, then
perhaps I will give it a closer look on my own. But we
go full circle there....because I still need a service
manual before I can do anything, and I do not buy very
many for the hell of it at $25 a pop. In most cases,
only the individual user stands to gain from whatever
I develop for some off-the-wall scanner, so the first
requirement is for the both of us to have the service
manual. He has to pay his share of the freight.

Then we go from there.....

The BC-895XLT does not garner enough of my interest at
face value for me to go stand in line waving cash for
a manual that I may never use. You do that, instead, since
you're the interested party who stands to benefit the most;
and then give me a copy for my library and we'll see what
crawls out of that puppy and shouts for attention.

It really can't be any other way, if you think about it.

I don't know Cincinnati, but I am sure that if you look in the yellow pages under "Radio - Citizen's Band" you may find a few dealers. You may however be better off doing mail order from someplace look Scannerworld or Grove or maybe 1-800-SCANNER

Well, I dunno about that. Maybe he was drunk or dyslexic.
Maybe it didn't chap his hide until later. I dunno, I
can't speak for him.

Sometimes you don't know you've been had until you
think about it..... I've been to COMDEX many times.
It's real hard to think there. Glitter Gulch and all....

999. HF on Pro 26--Mod? Bill Cheek?

Newsgroup: rec.radio.scanner
Date: 1997-12-10 00:00:00 UTC
From: ferrot321@aol.com
Message-ID: <19971210002000.TAA25255@ladder01.news.aol.com>
Source record: 178057

I visited my local Radio Shack today and was pleasantly surprised when I spoke with one of their employees. He seemed to know a lot about scanners and said he owns a modified Pro 51 and that he can also put it into "test mode" (whatever that means).

Eventually we began to talk about the Radio Shack Pro-26 and why exactly was it recalled. He told me of a story about a disgruntled Uniden manufacturer who lost some money in stock. The employee then allowed, through simple wire cuts, for the Pro-26 to be able to receive from 14 MHz all the way up to 9999 MHz with no gaps (I cannot remember exactly what the upper limit the salesman told me). Also, the step sizes were able to go down to something like 10 Hz (sounds overexaggerated).

The Radio Shack employee told me that the Pro-26's were recalled immediately and that they were subsequently fixed. There is some kind of orange sticker inside of the Pro-26 that indicates whether if it can modified or not. My question is, is this true? If so, how is the mod performed. I will appreciate any helpful advice or info, especially from Bill Cheek.

Absolutely great. I received my radio in less than two weeks, and
the price was rock bottom. Recently, I ordered a case for the unit,
which they decided to supply for free because it took a little longer
than usual to process the order. Excellent place.

Bill

I E_Mailed you a few weeks ago, knowing you
are a busy man I kind of blew it off that you did
not return. You say that dozens are possible.
Can you enlighten those of us that are interested
in the BC895. One idea I have been pondering,
is there a way to make the AM / FM switchable
manualy, can a BFO be Installed to monitor
2 mt sideband. I have a BC895 and am shure
that the posibilities of making a good radio, into
a great radio are there.

Thanks

3 seconds after which the radio quiets and resumes
RW>> scanning. So, it's not really regular intermod, if there is such a
RW>> thing, it seems related to the CTCSS- squelch function. I called
RW>> RELM and spoke to one of the service people. He said it might be a
RW>> CPU related problem.

RW>Hi Gary,
RW> Thanks for the feedback on this. It will be interesting to see
RW>the resolution to this. Keep us posted please.

I will. My scanner isn't scheduled to reach FL until Tuesday, so I don't know how long it will take for them to get to it and send it back. I am really hoping that this is a fixable bug.

RW>> As I said in a previous post, the HS-200 is so good, it's hard to
RW>> believe that the MS-200 wasn't meant to be the same way.

RW>Exactly. This is the point I made in my First Impressions of the
RW>MS200. The HS200 set such a good example that the MS200 was a
RW>real disappointment in the interference department.

I should have read your review before ordering. But NOOOOOOOOOO, I had to be the first on the block to have one. :(

I haven't had a chance to compare the specs of the MS200 and the HS200 to see what the selectivity and sensitivity numbers are. Any idea?

Gary

Hello All,
I used my radio shack Pro-51 at the new California speedway at Fontana, California. I found by talking to other scanner enthusiast as well as the vendors that rent listening equipment that NO antenna works best as we are so close to the action an antenna will pick up TOO MUCH. I went on four occasions and removed the antenna every time with excellent results. Hope this helps.
Also I have learned that it is more enjoyable to use a 25db or preferably a 50db noise reducing headset as after a couple of hours of the listening as the annoying clip at the end of each transmission just becomes too much...
Neal
Anaheim,California
P.S. If you visit Disneyland anytime soon,Bring your radio,460.050(APD GREEN) it has some of the best dispatchers and action around including a fleet of hilocopters seven days a week.

>For Nascar use, I don't think the antenna will really matter that much -

Source record: 177727

I've realized recently that my old Bearcat 200XLT handheld is showing it's age (feature and appearance-wise) and am starting to look for a suitable replacement.

Looking in the most recent Grove catalog I received in the mail today, two handheld units caught my eye; they are the ICOM R-10 and the Alinco DJ-X10. Both appear to have extensive features and have similar coverage, but I've never seen or used either one personally and wanted to get some opinions from those that may have.

Is there anything specific about either unit that should sway my decision? I tend to monitor mostly police, fire/ems and businesses in the UHF range, with some VHF-hi and 800mhz for New Jersey State Police. Big concerns are intermod (a big problem in my area due to multiple paging towers), loud CLEAR audio output and quality of construction (something that impressed me about the 200XLT).

Any opinions are appreciated! Please email & post any reply.

- Eric

>work on commission, but is it true??

Nope, the Rat Shack guy is lying. i own a Rat Shack AND FOUR unidens, they are all very reliable. The Uniden are FAR and away the most popular at tracks, in fact my older two pick up some signals better than the newer ones. Go figure.

>Also, should I get the short,
>stubby antenna instead of the 6 inch one??

Stubby can help with bleed over, but your mileage may vary. bleed over at Dover is worse than Daytona. Stubby antennas are good if your strap the scanner to your leg, it doesn't jam onto your leg

>Also, what does "audio
>modified" mean. The salesman had no idea, and the box or booklet of
>this scanner does not mention it. Can radio shack "audio modify" it
>if I wanted??

Audio modified allows more volume from the audio jack. Many unidens don't put out as much volume at the headphone jack as they are capable of. Even with a headset it can be hard to hear, audio modified one Uniden 9BC200XLT), WORLDS of difference. the person who uses it cannot wear a full headset, so it helps. Rat Shack can't do it, try Racing communications, Racing electronics or Grove Enterprises

> Finally, I've heard there is bleedover at some tracks,
>is there a certain option on a scanner that would prevent this?? I

>know these are a lot of questions, and I'm sure I'll have some more
>eventually, but I don't want to get screwed. I appreciate any info
>any of you out there can give me.

as I said, bleed over varies, i have three different antennas to fight this depending on the track. my best one is one for a 70 cm ham radio, since it is tuned for the 440-470 MHZ range where almost all NASCAR drivers are found. try a ham radio supplier for one, its worth the money.
BTW, the number of channels isn't so important, two of my UNIDENS that i lend out only have ten channels, always set one for MRN radio network, they have the best announcers. My rat shack and the 200XLT rarely get more than 25 channels input, since you can only follow so many drivers conversations without missing out on the going ons. have fun, see you at Daytona.

Send it to UNIDEN, they still have a repair shop and service center.
Access Uniden at their web site and they have the info. there that you
need to send it in for repair.

I use a scanner at Atlanta Winston Cup races twice a year. I found it works best with NO antenna. You're so close you don't need one and if you do use one, you get bleedover from cellphones etc. Make sure the scanner you get has 800 MHz since most of the drivers are there. Also, you need good, noise reducing headphones to avoid damaging your hearing by turning the radio too loud so you can hear it over the track noise.

In article <3491018e.3261462@nntp.ix.netcom.com>, bilodea1@ix.netcom.com says...

I've had one for quite a while now. It's OK, but no great scanner.
Seems to lack sensitivity, and the aircraft are ALL off frequency
(this means the scanner has a problem, not all the aircraft :)

There's a mod out to bring it's frequency coverage down to the AM
broadcast band, but since it doesn't have any sort of BFO, you get AM
stuff only.

If I had it to do over, I'd probably keep looking. There's some much
better stuff on the market now.

Of course, it does cover cellular. But that gets boring after 5
minutes of "honey, bring home some bread" and "hey, Mikie, did ya see
Sandy's new zit".

Just my humble opinion and free advice, worth the price and no more.

Tony

>quirk of this otherwise outstanding radio?

It sounds like your receiver is a little miscalibrated. Yupi's, especially
the early 7100's, have a tendency to drift. Also the FMN filter may be a
little too narrow for some signals, especially cellular.

Try entering a known on-frequency station in FMN mode and using a 1 KHz
step tune up and down to the point where the speech becomes too distorted
to understand, or you are so far from the envelope that the signal drops
below squelch. The distance from the published frequency where this
happens should be similar both above and below (e.g. 4 KHz or so). If it
is markedly different then you'll need to get it tweaked.

Jamie,
Your best bet is to go the mail-order route. You can save quite
a bit over buying local. You can even order Radio Shack models
this way and save LOTS.

Hi Gary,
Thanks for the feedback on this. It will be interesting to see
the resolution to this. Keep us posted please.

> As I said in a previous post, the HS-200 is so good, it's hard to
> believe that the MS-200 wasn't meant to be the same way.

Exactly. This is the point I made in my First Impressions of the
MS200. The HS200 set such a good example that the MS200 was a
real disappointment in the interference department.

Hey all,
I was wondering if anyone can help me with scanners. I rented one at the track this year at Dover and loved it so I figured that I should get one for Christmas because I'm going to Daytona for the first time ever this year. Does anyone know what the best scanner is?? Uniden, radio shack or RCA. I got one from radio shack today that was listed at $379, but I got it at $179. It is called the PRO-60 and has 200 channels (1-100 for winston cup, and 101-200 for busch) and carries frequencies up to 999.9875 MHZ. Are radio shack scanners reliable and has anyone had problems with them?? The guy at radio shack said that the uniden scanners were piles of junk, and he said that the nascar fans he sold to returned the unidens for a radioshack version. I know a radio shack salesman said this and they work on commission, but is it true?? Also, should I get the short, stubby antenna instead of the 6 inch one?? Also, what does "audio modified" mean. The salesman had no idea, and the box or booklet of this scanner does not mention it. Can radio shack "audio modify" it if I wanted?? Finally, I've heard there is bleedover at some tracks, is there a certain option on a scanner that would prevent this?? I know these are a lot of questions, and I'm sure I'll have some more eventually, but I don't want to get screwed. I appreciate any info any of you out there can give me.

Well Brian, I have found that Radio Shack & Uniden both make some good
units and some bad ones (just like any other product and manufactuer).
As for the know-it-all that told you that Uniden makes "junk", my
question to him would be then why has Radio Shack had Uniden produce
scanners for them with the Radio Shack name? I used to own a Pro-24,
when I opened it to clean the inside of the LCD screen, what did I find
but a Uniden CPU!

Basicly sounds like you bought a decent scanner, and I would be leary of
of the salesman that you spoke to.

Lets see, you want a decent scanner that covers between 25mhz to 1300mhz
and you want to pay arround $80? Well I would like one also if you find
one. All your going to get for $80 is maybe a 10 channel handheld or
base unit with the very basic coverage. If you want something that
covers a more broad range of freq's (25 - 1300) your probably going to
pay arround $380 (believe that is what the BC3000XLT is selling for).

Good luck :-)

Hi All,

I thought you might want to know about the status of EEB.

I got this from the Goddard Club BBS.

John
KA3LIE

==========

Hi everybody: To add to John (N3KHK) Klim's msg, here is more info
pertaining to EEB for those of you that may be interested. The info
came from a member of the Laurel Amateur Radio Club.--Joe, KU3Z

==========

Subject: Deals at EEB ?????

Date: Mon, 08 Dec 1997 08:48:45 -0500

From: Irv McWherter <irvmc@erols.com>

Reply-To: irvmc@erols.com

Organization: Invigorating Life Marketing

To: larc-l@webtrek.com

I received this note from a friend. Thought you all might like to
take advantage.

I called EEB last Thursday and got a recording that
"The retail store is open only on Saturdays, 10-4.
If you are a Government or Commercial customer,
call 703-938-5309." On Saturday afternoon I went to the store.
Here is a summary of comments by Manager Bob Hatter.

"The Owner has made a decision to shut down EEB
because the ham radio business is not sufficiently
profitable. Future efforts will focus on the
Government/Commercial core business. The plan is
to sell all the retail merchandise by the beginning of
January. Discounts will be made, probably deepening
towards the end. The objective is to clear everything,
but not below cost." If you want something specific,
you are welcome to call Bob at 703-938-5309 to
seek a deal. He will ship if desired. Bob speculated

about further shaking out in the ham radio business,
and sited examples of lack of willingness to pay a little
more to get local service.

So, I guess there are at least three more open Saturdays.
Sad to see EEB close their doors, but business is business.

-> work on commission, but is it true??

Typical RS Salesmen BS. In Fact UNIDEN is the Manfacturer of the two
Latest Trunk Tracker Radio Shack scanners so I don't think the Corporate
Headquartes would agree with him. And neither would mulit-thousands of
Uniden(Bearcat) Scanner users.

-> Also, should I get the short, stubby antenna instead of the 6 inch
-> one??

No longer is better basicly on a Hand held scanner. Unless you are
snooping where yuo are not wanted and want to hide. :-)

Brian,
With regards to using your scanner at the races, you should use
the short stubby antennas so that you only get signals from the
local area, which will hopefully be your car & pit crew comms,
and avoid strong overload from pagers, etc in the 460s MHz.

Strong signals,

Article Reprint from August 97 Monitoring Times Page 72
"The World of Ham Radio"
A Gem of a CD
Ike Kerschner, N3IK

Have you ever stumbled onto something truly valuable? Remember the surprise, the thrill? You can experience that same feeling when you examine a copy of the CD-ROM software by AMSOFT called "The World of Ham Radio"! This is one of the best bargains I have laid my hands on in a long time.

This CD has been around for a few years, and I have seen it for sale at several hamfests. Several years ago I looked at it and felt the CD provided a decent call book with some nice software.

The latest copy, however, knocked me over! I held a copy of it for several weeks before giving it the once over, but after I started I couldn't stop. Programs that I had on separate disks were available to me in one location with an excellent menu, and moreover, they would run directly from the CD. For many years I have collected shareware at the price of 2 to 6 bucks a disk, finding many I liked but a lot more that were just ho-bum. If I were to add up the cash laid out to come up with a handful of decent programs I am sure it would be several hundred dollars.

"The World of Harm Radio" is a collection of excellent software, in fact, almost all of the programs I have chosen over the years as being the best are on this CD, plus a lot more, to boot. All of this and a call book, too! Looking up a call is a snap in AMSOFT's "World of Ham Radio." But, let me give you a brief tour of what else is on this CD.

When you type CDVIEW, a listing of many different subjects is presented to you. Choose "Antennas," for example, and you will find 26 different antenna programs that will provide full information on a host of antennas, from simple long wires to yagi and complex loop antennas.

"Basic programs" are a wide range of simple programs written in BASIC which will run directly from the CD. Examples of the Basic listings vary from antennas to z calculations.

Twenty-six different programs deal with Morse code - from learning programs to programs that will allow you to send Morse from your computer keyboard as well as copy code via the computer and shack receiver.

A variety of engineering programs are included, among which are a a simple-to-use CAD program for drawing schematics, a program to lay out PC boards, and tools for designing specific circuits.

Eight different logging programs give you anything you want for contest logging, general logging, and certificate hunting.

One program I particularly like is a training manual for the oscilloscope. As you go through the Oscope manual the computer shows demonstrations of what will appear on the screen of your oscilloscope under different testing situations. Last Christmas a good friend wanted more info on using an oscilloscope and we spent several weekends going over the use of the instrument in my shack. If we had this program, I am sure my friend would have learned a lot more a lot faster.

Equipment modifications also are included on the "World of Ham Radio" CD. I examined all of the mods available on the CD and am anxious to try several, especially one for a scanner I have. Not every piece of equipment is covered, but there is a lot!

Eight propagation programs allow user to determine the best time and frequency to work various parts of the world.

Included are 36 packet programs from very simple to very elaborate terminal programs, information on using packet, and circuits for various packet projects. If you ever wanted to try RTTY, 10 programs on this CD will let you get your feet wet in this interesting mode with minimum outlay.

A very interesting listing for satellite comm- unications provides info on operating and tracking programs, again from simple to fairly complex. There are several programs for SSTV and WEFAX that I am just now beginning to explore.

As always, there is a "Miscellaneous" listing containing 89 programs which I have only begun to explore. There is also a question and answer section that deals with many subjects, Scanner buffs and SWLs will find a lot of good information on this CD: frequency lists, data bases, modifications, and more.

In short, "The World of Ham Radio" gives you hundreds,
if not thousands of dollars worth of information on ham radio,
and all at a price of $29! If you have a CD drive on your
computer, grab a copy ASAP. If you don't have a drive,
consider putting one on your machine just so you can
use this super CD.

Ike Kerschner, N3IK

I believe you turned The TC1 control, The reason it wouldn't be C4 is that C4 is a fixed cap. not a var. cap. C4 is visible from inside the batt. compartment with the case open it is on the left side (with scanner face down and antenna at top right) inside the shielding. The control TC1 is the trimmer for the 6.4 mhz. crystal on the logic board. If you look into the hole with a light you will see the label below it. Sound like the one you are talking about ? As to adjusting it I'll leave that to Bill. I don't mess with the main board much. Steve

There's a whole lot of confusion about the 'codes'. They do exist and
most definitely can be used to your advantage. I'm the one that posted
them. These codes allow me to write programs to control the radio with
my
computer. I've already posted one program and am working on the second.

This information is NOT in the manual.

Copy of codes below:
Picture of Windows app being developed also attached:

Information on the BC895XLT I/O port and data format |
From: A. Giammarino (agia@ix.netcom.com) |
Last Update: 12-10-1997:2010 hrs |
*** View with a mono-proportional font *** |

Cable information:

Connectors used: Female DB9
1/2 of an 8 pin DIP socket
(cut in half lengthwise)

Wiring: DB9 Socket
3---------------1 data into radio
2---------------2 data from radio
5---------------3

Pinout on BC895XLT is such that pins 1 & 5 and 2 & 4 are tied together.
Pin 3
is GROUND. Plug the cable into a computer serial port and connect the
socket
end to the radio. Make sure that whatever wiring convention you use,
that the
connections depicted above are maintained (e.g. not reversed, etc...) I
have
my socket end of the cable connected to the first three pins closest to
the
AUX jack.

==========

Discriminator (baseband audio output):

Look for IC3, a small 16 pin surface mount IC that is a MC3371. The
baseband
audio output is pin 9. The MC3371 IC is over on the right and about
midway
between the front and the rear. The crude diagram below shows the
approximate
location of this chip at the 'X'.

```
--------------REAR---------------
| |
| |---| |-------| |
| | | | | |
| | | X| | |
| | | | | |
| |---| |-------| |
| |
| |
--------------FRONT--------------
```

Pin 9 (or any pin for that matter) is real hard to get to with a
soldering iron.
Proceed at your own risk!

I soldered a small 1/8W 10K resistor to this pin and added a .01 uF
capacitor
in series to it. From there I run a small piece of shielded cable
outside and
I grounded the cable's shield at the screw near the AUX jack. The
shielded
cable is terminated with a female RCA jack. I did this rather than
drill a
hole for a panel mount RCA jack.

I copied the hookup information from the numerous POCSAG decoder
circuits on the
internet but I kept the 10k resistor and .01uF inside the radio rather
than risk

dangling this IC's connection outside the radio. I was able to
successfully
hook up the baseband audio output to an op-amp circuit and feed a POCSAG

decoder program.

Interesting note: This scanner has two areas on the PCB that are
enclosed.
One of them is accessible, the other has its access screws glued over
with
some epoxy to 'deter' you from getting inside. Also to the side of that

enclosure is some more epoxy that looks like it's covering some parts
up.
I'm guessing this may be related to the cellular band lockout but I
could be
wrong. Besides what's to stop someone from using an up converter anyway
?

==========

Data format:

The BC895XLT communicates at 9600 baud, 8 bits, no parity, 1 stop bit.
Using
a shareware scanner program I found on the internet, I monitored the raw
data
between the computer and the scanner with a second computer. That
coupled with
some guesswork yielded the following so far:

Note: You will need to put the scanner in the remote mode. Press and
hold the
ALRT/RMT button until the radio beeps twice. Also, the scanner is case
sensitive - USE UPPER CASE LETTERS.

==========

AC: Clears all memory and resets the radio.

AR: status of LINE for AUX OUT
ARN: turns LINE on
ARF: turns LINE off

CC: responds with N - meaning unknown.

CD: CTCSS search function. Causes CTCSS in display to flash. Responded
with 23
when it found a PL of 146.2.
CDN: function on
CDF: function off

CS: responds CSxx; xx two digit number representing CTCSS tone

CSxx: sets CTCSS tone xx (e.g. xx=11 for 97.4 Hz)

CT: CTCSS function - Tone Squelch.
CTN: function on
CTF: function off

DL: responds with status of DELAY function - N for on, F for off
DLN: turns DELAY on
DLF: turns DELAY off

DS: Toggles the DATA button (data skip)
DSN: function on
DSF: function off

IC: While trunk tracking, sending a KEY04 and then IC reponds with a scan list bank and number followed by the trunk ID number.
(Example: IC A1 001776 - where trunk ID 1776 is stored in trunking scan list
bank A, slot 1. See page 45 of user's manual for details.

ID: Turns on/off trunk ID number being sent to data port while trunk tracking.
IDN: Sends ID number to port.
Format is: ID s nnnnnn; s=S while receiving, s=E at end of transmission. nnnnnn=trunk ID number.
IDF: turns function off.

IL: Responds with list of locked out trunk IDs.

ILR nnnnnn: While holding a trunk ID, locks trunk ID nnnnnn out.

IS: responds with letters ABCDE or sometimes NG. This is related to storing
the trunking ID scan lists.

IS b: stores b into IS function. Passes bank letter to IS function.

LL: read lower limit (for searching between frequencies).

LLfffffffff: set lower limit.

LU: read upper limit.

LUfffffffff: set upper limit.

LO: L/O (channel lockout) status
LON: lockout channel
LOF: restore channel

MA: reads data from current channel. Similar to above. Does not work while
trunk tracking.

MAccc; ccc=channel number (e.g. 001): Puts radio to channel ccc and responds
with data (e.g. C001 F04535000 TF DF LF AF RF N00). Will halt scanning.

Note: F=off, N=on
TF=freq. was entered as trunked (shows off)
DF: DELAY status (shows off)
LF: L/O status (shows off)
AF= Unknown
RF= LINE status (shows off)
N00=reflects CS number (CTCSS not set)

MD: status command that returns a two digit number
(there's more unsolved MDxx codes).
00 while scanning
01 is returned after a write to a memory channel or in manual
mode.
06 mode radio is in after TRUNK key is activated (KEY13, not
KEY13H)
07 when in trunk tracking mode.
08 monitoring a held trunk ID
17 after a write through the RFnnnnnnnn command.

MU: Mute AUDIO
Responds A - seems to be default MU setting.
MUA: Un-mutes audio, returns squelch to normal
MUF: Un-mutes audio, opens squelch
MUN: Mutes audio

PC b: Shows priority channel for bank b.
Example: PC A returns PC A001, channel 1 is the priority channel
on
bank A.

PMccc: read contents of memory channel ccc. Does not halt scanning.
Similar
to MAccc function.

PMccc ffffffff; ccc=channel, ffffffff=freq.; Programs channel ccc with
freq.
Note there is a space (ASCII 32/20 hex/SPACEBAR) between the last c and
the
first f.

PR: status of PRIORITY scan function.
PRF: sets function off
PRN: sets function on

QU: Receive activity indicator. Used to signal computer program
QUN: causes data port to output + if receiving a signal and - if
not.
QUF: turns off QU

RI: responds with status of unknown function - N for on, F for off
RIN: turns unknown function on
RIF: turns unknown function off

RF: responds with freq. in format ffffffff only if this frequency is set by the
RFnnnnnnnn command. If the frequency is already in memory assigned to a channel
then the scanner responds NG. Does not work while trunk tracking.

RFnnnnnnnn; nnnnnnnn=freq. (e.g. 470.5875 MHz -> 04705875): Dials up the freq.
in the radio (like the VFO mode) but does not program it into channel memory.
Scanner replies OK after command.

RM: Reads mode (e.g. NFM, AM, etc.)

SB: responds with bank letter(s)

SB b: goes to/turns on bank b. Multiple letters can be used. Works while
scanning. Does not work while trunk tracking.

SG: S-meter reading and frequency (e.g. S014 F04535000). No signal responds
S014 for me while a strong NOAA weather station returns S026.

SQ: responds - when squelch is closed and + when open or receiving signal.

SS: responds with END. Meaning unknown.

ST: returns 0000000 - meaning unknown. Produces error while trunk tracking or
scanning.

WI: returns Wnnn Fffffffff; nnn=three digit number of unknown significance and
Fffffffff where the lower case f is the frequency. Works in MANUAL or SCAN
mode (example output: W084 F01541750). This number can change even though the
same channel/frequency is held on the radio. The number seems to vary slightly.
==========

KEY functions. Just type KEYxx and carriage return; xx=number below. Acts
the same as pressing front panel buttons. KEY functions with H at the end
simulate pressing and holding the key.

Note: Some of the KEY functions producing errors are likely because the command
is issued out of context. They probably are valid functions.

KEY00: functions SCAN button
KEY01: functions MANUAL button

KEY02 t:Functions numeric keypad (Untested on '.' & 'E' -- will advise)
For example: entry of trunk ID numbers while trunk tracking:
To enter a trunk ID of 1776, the following sequence would be
used:
KEY02 0, KEY02 1, KEY02 7, KEY02 7, KEY02 6, KEY07
For 368: use 0,0,3,6,8 (maintain a five digit number for
these IDs!)
For 25808: use 2,5,8,0,8
KEY03: unknown, responds OK
KEY04: Enters the currently being received trunk ID into memory. See
page 45
of the user's manual for details.
KEY05: Toggles PRIORITY (same as PR)
KEY05H: Same as holding down PRIORITY button (assigns channel as PRI
channel)
KEY06: Toggles L/O (same as LO)
KEY06H: Same as pressing and holding the L/O button.
While trunk tracking, enters into restoring Single ID mode. See
page
42 of the users manual.
KEY07: HOLD button. Steps up through channels (will not put radio into
manual
from scan). ID hold mode while trunk tracking.
KEY07H: Same as holding down HOLD button
KEY08: LIMIT button. Steps down through channels
KEY08H: Same as holding down LIMIT button
KEY09: SRC button
KEY10: Turns on WX
KEY11: Toggles DATA skip function
While trunk tracking, shows which bank is being scanned
KEY12: Toggles DELAY (same as DL)
KEY13: Toggles TRUNK button.
KEY13H: Same as holding down TRUNK button (trunking programming mode).
KEY14: Functions DIM button
KEY15: Functions STEP button
KEY16: Toggles AUX (LINE in display) function
KEY17: disconnect radio from computer (activated ALRT/RMT button)
KEY18: bank letters began flashing or ERROR. Perhaps the SEND button?
KEY19: Toggles AUTO button.
KEY20: Toggles CTCSS (same as CT)
KEY20H: Same as holding down CTCSS button (Enter CTCSS search mode)
KEY21 b:Specify a bank to trunk track. Do after a KEY13 or KEY13H.
KEY22: Toggles FREQ/CHAN
KEY23: Toggles LOCK

==========

I have been successful in programming the radio by creating a text file
and
sending it to the scanner. I had to introduce a small delay between
characters

so the data wouldn't overflow the scanner. Each channel and frequency
is on a
separate line followed by a carriage return (hex 0D) and line feed (hex
0A).

Update: My error, but my terminal program strips off the line feed (hex
0A).
Apparently sending the line feed causes the radio to reject the data.
TERMINAL.EXE from Windows 3.X has to have the 'Strip LF' enabled under
the
'Following CR:' option. This is accessed by 'Send Text File' from the
top
memu. In BASIC, I just send a CHR$(13) which is just a carriage return.

For example: (the <cr> is invisible - don't type it. Using a simple
text
editor, the editor will actually append <cr><lf> where <lf> is a line
feed)

PM001 04537250<cr>
PM002 04535000<cr>
PM003 00459400<cr>
etc...
==========

Software Update: No Visual Basic program yet. I will start development
on
that in the near future.

The MS-DOS application is functioning and ever evolving. The latest
version
no longer has the trunk ID and assignments hard coded into it. The
program
now gets its data from a specially formatted text file so anyone can use
it.

Here's a snippet of the text file:

000848 SDPD Tac 6
000912 SDPD Tac 7
001008 City Tac 1
001072 City Tac 2
001104 City Tac 3
001296 Southern Dispatch

Below is a screen print of the program:
Note that it intercepts unidentified trunk IDs (where the OK is...), a
count of the current trunk (Command 1 has been received once so far),
the frequency of the received transmission, and its signal strength.
At the bottom is the file name that contains the data.

BC895XLT Scanner TrunkTracking Identification Program (Beta)

Displays count, trunk ID, and assignment.
Press Q to quit.

------------------UNIDENTIFIED TRUNK IDs------------------

Last unidentified Trunk ID : OK @ 00:25:00

-------------------------RECEIVING--------------------------

(1) ID:048816 - Command 1

------------------S-METER AND FREQUENCY--------------------

Receiving Frequency: 856.0500 MHz
Signal Strength (0-13): 8

---------------TRUNKING ID & ASSIGNMENT FILE---------------

>d:\bc895xlt\develo~1\sandiego.dat

If anybody finds more commands or any other pertinent information let me
know.
I'll update this list as I find out more.

Hi Brian,
I've used my RS Pro-34 at both Dover and Pocono with a 8" rubber duck
with no problems. A good set of Headphones is a must at the shorter tracks.
I guess your purchase is a good one. Price wise anyway. Also GRE and
Uniden make scanners for RS, so the guy at RS doesn't know his hole from an
ass in the ground.

Ron

Are the physical locations of AM broadcast transmitters charted?

Aeronautical Non Directional Beacons are depicted on Sectional, Terminal Area, and World Aeronautical charts, as well as Approach Plates. But, commercial AM broadcast transmitter locations are not. Although they are mentioned in the current edition of Airguide Publications Flight Guide, the bearing and distance to the airport is no longer provided as it was in the past.

Where can this information currently be found?

1074. Re: A decent scanner for under $80

Charles Simmont (simmont@extremezone.com) wrote:
: Lets see, you want a decent scanner that covers between 25mhz to 1300mhz
: and you want to pay arround $80?

First off, he gave 1000mhz as his upper limit, and second.... he didn't say he actually wanted one that would cover that whole range. He just said that that's the freq range he was interested in because he knew it had "interesting" whatever... :)

: one. All your going to get for $80 is maybe a 10 channel handheld or
: base unit with the very basic coverage. If you want something that
: covers a more broad range of freq's (25 - 1300) your probably going to
: pay arround $380 (believe that is what the BC3000XLT is selling for).

If you pay attention and look around the newsgroup enough, you will find a deal... for example, I just got a Pro-60 and a Pro-34 for $100 each. The 34 is cell modified, and the Pro-60 even gets full coverage between 30-512mhz. So, buying a used Pro-29 for around 80 bucks isn't completely unreasonable.... and it is very good for a beginning scannist.

My primary scanner is a Pro-60 and I've been very happy with it. Not
much intereference from images, and the battery usage is fine - despite
many people saying that they suck batteries down. :)

: work on commission, but is it true?? Also, should I get the short,
: stubby antenna instead of the 6 inch one??

For Nascar use, I don't think the antenna will really matter that much -
you will be so close to all the transmissions, you are likely to pick it
up well with either kind.

: Also, what does "audio
: modified" mean. The salesman had no idea, and the box or booklet of
: this scanner does not mention it. Can radio shack "audio modify" it
: if I wanted??

While I am not sure about that term, headphones are definitely a must at
a race. And I mean the full covering "earmuff" type headphones. :)

: Finally, I've heard there is bleedover at some tracks,
: is there a certain option on a scanner that would prevent this??

The Pro-60 is a triple conversion scanner, which is supposed to really
cut back on image interference. I think you will be a happy with it.

First Radio Shack & Uniden make good scanners.There are always some lemons.
Get a set of good headphones like you probably rented
at the track.
Get a stubby antenna.The reason for this is to pick up
only the cars and not the police and fire dept's around
the track.You don't want to pull in all the signal from
far away.
Audio mod is where they increase headphone jack output.I don't know how to do
your's.Check some of
the mod sites or ask at the track.There are a couple of
scanner dealers at the track that may be able to perform the mod,

Good luck
Enjoy Daytona
Robert

Emilio Goldtein wrote in article
<01bd04c6$a86d1a00$c1cfe1cf@uibel>...
A guy on the net is offering a new antenna from Ottawa xignal corp. It
stands about 13 plemeters above the ground, but with no z-formulatory angle
along the dipole regulator.
I'm not sure it will pull in the sting operations.
Is it worth the three hundred dollars or should I go with the positive
z-angle for 500?

If it only stands 13 plemeters off of the ground, it's no good. You'll need
at least thirty. Without the z-formulatory angle you're sunk. One isn't
good enough, because the cops are on to it and have adjusted their radios
accordingly. You'll need three. But on the other hand, a positive z angle
will only pull in comm's to the north. Use an omnidirectional potentiometer
to compensate. You shouldn't need a dipole regulator, unless you are south
of the equator.

Of course, if you understand what I just said, you shouldn't be asking in
the first place.

Glad to help.

If the "everything" that you want to listen to means all the police,
fire, etc frequencies - you will probably want to get one of the latest
TrunkTracker scanners that allow you to follow trunked system freqs.

If the "everything" that you are talking about is cellular phone calls,
then I suggest looking for a BC200XLT - the granddaddy of kick ass scanners.

I recently had the same problem. R.E. Morin was kind enough to send me a homemade design (I hope Mr. Morin doesn't mind me posting this. I take no credit for the original design). Attached is a ZIP file containing his original design along with a modification I made for the radials using crimp type connectors. It works great. I have already made two.

Find me the frequency for those electric-shock dog collars. While your at
it, find plans for a gadget that transmits a signal on that frequency and
zaps Fido. Then build it. Then stand in a bathtub full of water, put on the
collar and press the button. Repeat as necessary.

Dogs Dazed and Man Dead in Bizarre Electrical Cult Suicide. Film at 11.

Hello Bill,

Sounds like your 7100 may be off frequency slightly. Or have an alignment problem. Does it only do it on the one police dispatch channel or all strong signals?

If the signal is really strong, you might try more attenuation or using a less efficient antenna to see if that helps the distortion.

I doubt that you meant to say that you tuned up 1 or 2 MHZ, maybe 1 or 2 KILOhertz?

But, since I don't own one, maybe an owner will come along and identify the problem.

Please let us know what you find by posting here.

Regards,

Bill

wrote:

>I came into Amateur radio as a Tech plus because I did not want to be
>part of a group that wanted more with less effort.

some people do spend lots of time on technical or machinary nature...
not simple morse.

> 4 months later I'm
>Advanced and when I started I didn't even know how to send SOS.

> Being in
>Amateur radio is knowing code not complaining about code.

Many coders (and no-coders of course !!) are now suggesting to
provide the alternate way of exam such as practical or machinary
nature. As I have written before, not knowing how the packet works
is no better than not knowing the code. Not knowing how the power
supply works is no better than not knowing the code. Period.

> To the people
>that are satisfied with being a no-code technician the following does
>not apply.

>This is for all the complainers out there.

> If you would put as much
>effort into learning CW as you did in complaining about it you all would
>be over 35 wpm in less than 1 month. Application is everything in
>teaching ones self anything.

We DO have codes. Many of us are coders who are against the
requirement of CW (not totally, but why morse takes care of all the HF
bands ??) instead, we suggest the practical exam.

>I also have a friend that went from tech plus to extra in 5 months he
>first received his license july 19 1997 and today he received his extra
>class license, amazing what application and self driven attitudes do for
>a person. My hats off to the man.

I did my code receiving practise in a day (all day) and I passed the 5
WPM test on the same day. What a surprise.

>Learn code or be satisfied with where your at DON'T bitch and complain
>to the people

listen to us !! we are the coders !! the coders disagree with
the code requirements.

>GET IT OR GET OUT.

and this is a typical pro-coder's attitude toward ham radio (or toward
other people shall I say). This is the real problem in ham radio
nowadays.

Church and prayer may do you some good Bill... You seem to have a fascination with bear, bull, and bird shit. I would highly suggest counseling for this, it's not healthy.

>
>As for the rest of my reply...which was TO HIM; not you; no
>hatefulness to it at all; just the hard core truth after thousands
>of similar inquiries that go nowhere.

Not true, when you posted here for all to read under the subject as listed above, your response is to ALL of the 895 folks, not just him. Oh, I am sorry, perhaps you should read the faq for newbies on the net prior to posting. E-mail is the button you intended to push bill. Aren't those inquiries are what shows you what the consumer is interested in? If a thousand people asked me about a mod for the 895 I would definately consider working something up and putting it in my next book. Oops, I almost forgot, you don't give a damn what the consumer wants, just what YOU want.

> Get outa my life, dude.
>I'll give a hang when you pay me; but not as long as it's free.

Well you will get your wish, old-timer. This will be my last reply to this thread and to you as you have wasted too much of my time. I'll fight with you when you pay me, but not as long as it's free.
Incidently, don't bother to ask if my "Unemployment" check will ever be spent

on cheek trash, it's not even worth wiping with...

>Well, I wish there *were* others.

Hahahahahahahahahahahaha!!!!!!!! Gee, you SHOULD take up comedy! Then you could feed those illegitement children of yours...

>especially for grubby, ungrateful, bony, booger-pickin >fingers like yours, pal.

I won't even justify this with a response...

>I don't see YOU working 12-18 hours a day for the >betterment of the radio scene. Or for the betterment of >anything. for that matter....certainly not for free, *if* you >work at all....
>And THAT is a big *if*.....

Do you REALLY call what you do "betterment of the radio scene"? Sounds like you have been nursing on that urine too long... Take a prozac and your geritol and get outa the way. I do work in radio though, just not the scanning variety. Perhaps I could do a show on senility and have you as a guest? Or maybe one on the arrogance of washed up engineers? We all have to work william, welcome to reality. I don't expect you to give your stuff out for free, but as a former customer myself, I do expect some courtesy which obviously you do not intend to give. Take heart though, when nobody buys your crap, you will remember all the people you crapped on and realize that they WERE your customers.

End of story.

Mark Haynes (mhaynes@aristotle.net) wrote:
: I've read you say that before. What are your reasons for choosing the
: 2004 over the 5 or 6? I'm curious because I have a 2004. But have not
: had any experence with the other two. I know the metal case is a plus.

: I came into this hobby late and lucked a 2004 that had been stored and
: had very little use.

The 2004 is better constructed, but the downside is the keyboard is not as
good.
Also:the 2004 is slower, and a bit less sensitive on some frequencies(but
not enough difference to avoid it).
Also-some 2004's have reliablity problems, owing to so-so wave soldering
on some of them.
If you find a good one cheap, it's a nice radio.
One other thing-since the 2004's did not have a off switch for the
backlight-most of the radios you will find will have a very dim
backlight-and the part is no longer available from Tandy.
In general, with the exception of the plastic case, the 2006 is the best
of the 3 (2004, 2005, 2006).
But try to find the B version of the 2006, to improve the chances of a
good backlight.(the B version has a off switch instead of a dimmer
switch).

My opening paragraph states that the 2050 is simply a base/mobile version of the PRO-90. And the PRO-90 is a clone of the BC235XLT. So the 2050 is like the BC235XLT which means both are totally different beasts from the BC895XLT.

My venererable ole Pro42 really has lost its shine up against the new Pro line.
Is there anything I can do to open up its range. It barely gets up into the
500's
if memory serves me correct. Yeah I know its only 10 channels and REALLY
low end..but it was my first and has served me well and I;d hate do just
relegate it to collecting dust in the closet

Thanks

Hi Bob,
I consider it a great privelege to receive compliments from you,
Bob, one of the names that is known worldwide for your knowledge
of radios and the monitoring hobby. Not to mention your monthly
articles in MT dedicated to helping us all know more about the
radios and products on today's market, as well as giving us the
info we need to make informed buying decisions.
Let me thank you for the contributions you have made to the
hobby over the years from RCMA to MT to USENET to SCAN-L and
beyond. And hopefully for many more to come!
Happy holidays and of course, happy monitoring to all!

Hi Mark,
Man...you guys gotta stop this stuff...my face is getting more red by the minute! Have you no shame for embarassing a guy so? ;-)
Seriously, I do thank you for your compliments and hope I can continue to provide information that is helpful to us all. I am often inspired by the hard work of others such as yourself and Mike of CFLG, and countless, selfless others, who help bring exposure of this wonderful hobby to many people. We are all the better for it.
As anyone who e-mails with me can attest, I do love this hobby, although at times it seems more of a lifestyle because it takes on a life of its own. Each hobby needs a few good supporters to help keep the ball rolling and I consider myself to be in the best of company as there are many of us who give back to this wonderful form of recreation just a little of what we receive from it.
Believe me when I say that I wish I could do more. If only there were several more hours in a day. But I know that I am not alone for it is with the help of many others who make my labors even more rewarding. There are so many who have contributed to my reviews and web page contents. I would like to thank each and every one of you for your help.
And due to the amount of e-mail I receive each day, I know my efforts do make a difference. Which pleases me to no end when I hear of someone who just got their new radio after seeking my advice on what would be a good model for them. Keep that e-mail coming!
I thank you all for your support and efforts and urge everyone to do what they can in their own way to help OUR hobby grow and

prosper. Overall, it is a very good time for listening when you consider all the products, accessories and publications at our disposal. As well as all the people out there offering up their opinions and web pages. Every bit counts. Let's all do our part to keep it that way!
And as cheesy at it may sound, LONG LIVE RADIO MONITORING!

Your mini review said that it was identical to the Bearcat. However,
in your table it shows that the RS version does not have a tune knob
nor does it have an S-meter. I thought the Bearcat version had both.
Just curious.

Thanks for your time and support to this newsgroup.

>There are lots of people using pre-amps, and figuring they are doing the best they can. My point is that a better antenna will almost always provide better signal than a pre-amp <

This statement reflects the best of reality based thinking.

A reasonably high quality receiver will frequently have more sensitivity than can actually be used. Making more signal from an external device a source of more noise and headaches than actual improvements in listening. And unless your installation is highly prone to man-made noise induced into the transmission line of your antenna, a pre-amp will not increase the number of weak stations you will be able to receive, but will only allow you to hear what is at the antenna, before becoming overwhelmed by the induced noise. However, a preamp will add its own self noise to the existing noise floor of your installation, and since all but the most intense man-made induced noise can be eliminated by a more meticulous antenna/receiver installation, a pre-amp may actually reduce your ability to hear the weakest signals arriving at your antenna.

The other major issue is that a pre-amp makes your installation more susceptible to locally generated RF overload. Much of this overload will appear as hash, or ghost images spread throughout the spectrum...making the bands appear livelier than they are. This extra noise is actually what most operators using a pre-amp point to when explaining their decision to add the extra device. It is however a mythical boost in performance, that actually covers up signals that would otherwise be heard. If you ever have the occasion to hear a professional monitor receiver connected to a very strong antenna, you will notice immediately how QUIET the bands are. And how weak signals, though still weak, are more easily heard.

The maxim has always been to go with a very strong, well designed, passive, purpose built antenna/transmission system, of sufficient gain. By beginning with such a good running start and having a better grip on weak signals in the first place, you may actually be able to hear more signals better on a lesser receiver.
Don't waste your money on extra implements...Improve your installation.

I am finding some distortion on my Yupi 7100. It happens only when I use narrow FM mode and happens mostly on strong signals (it has a signal-strength meter). The distortion sounds like the police dispatch itself is overmodulating, but I know that is not the case because it isn't distorted on my BC 890. I have tried the attenuator on the Yupi, but it didn't make a difference. The volume is not turned up very high at all. I am running the Yupi on ni-cads, but having them fully-charged or nearly drained didn't make a difference. I can lessen -- but not eliminate -- the distortion by setting the tuning step to 1 MHz and tuning up 1 or 2 MHz from the correct frequency. Do I have a lemon or is this simply a normal quirk of this otherwise outstanding radio?

Please let me know if anyone has any information on this. Thank you for your help.

1153. ### DDI for NAMPS

Newsgroup: rec.radio.scanner
Date: 1997-12-11 00:00:00 UTC
From: tinkerman97@usa.net
Message-ID: <EL04w2.9xr@news2.new-york.net>
Source record: 177964
Cross-posted to: alt.radio.scanner,alt.radio.scanner.uk,rec.radio.scanner

As the heading says, I'm looking for a DDI for NAMPS. Any other means
to collect statistics off the air and follow calls through handoffs
also welcome.
Thanks in advance for any help offered.

Note: when Replying, please email me directly in addition
to posting here, so no responses are missed. Don't forget to
remove the "97" from my email address inserted as an anti-spam
counter measure...:-)

Thanks and best regards,
Tinkerman

I have both and prefer the BC895's 3 main features that the handheld does
not have:

1. Computer Interface
2. S-Meter
3. Built in CTCSS

The CTCSS is especially useful in urban areas. I can take my BC895 to areas
where the intermod wipes out the 235, and still receive comm's loud and
(mostly) clear. Since it sounds like portability isn't a big deal I'd go
with the BC895. When you do go mobile, Rat Shack makes a universal DC Car
adapter that powers mine just fine.

For a real treat try listening to your local security companies. These guys make the keystone cops look like the FBI! Search the business bands and trunked SMR frequencies. You can't miss 'em, they sound like drunken old farts trying to be cops (oh wait, that's what they are....)

An example:
When I lived in California I used to listen to Copper Eagle Patrol on 463.7500 and 463.8000 almost every night. One night around 2:00 or 3:00 AM I heard the patrol supervisor call in a vandalism/burglary of a liquor store - apparently a brand new account. He reported broken bottles, glass, cigarettes, etc. all over the parking lot. To make things worse, the guard who was supposed to be watching the place was no where in sight. The patrol supervisor found his vehicle, but no trace of him, and feared the worst. The LA county sheriff's department was called in and began to investigate. About 45 minutes later they found the guard, strolling down the highway, drunk, with stolen merchandise crammed in every possible pocket. Further listening on the "Supervisors Only" channel (463.800) revealed that this was that guard's very first day with the company! I laughed off and on for a week after that, especially whenever I saw one of their trucks!

Happy listening!
-Phil

Hi Bill,
If you are not going to use the TrunkTracking feature
then your money is probably best spent elsewhere. It does
have a few nice features...300 channels, 50 search-skips,
service search, good interference rejection...but for
most people this is not worth $300. Even if you mail order,
you're probably talking $250, which is still pushing it.

Not a fascination. Only an iteration of the baser
elements that appeal to YOU so well. Obviously, you
understand not the higher English as all.....this

That is patently philistinic. My response was -TO- him.
"895 others" were simply privileged to eavesdrop. You TOOK the
liberal privilege to open your mouth to change feet.

> Oh, I am sorry,

I know. You were born sorry.......That's a personal problem.

> perhaps you should read the faq for newbies on the net prior to posting.

Perhaps. But then maybe I wrote that FAQ.....

> E-mail is the button you intended to push bill.

No, Oh Mindless One. I pushed what I *intended* to push.

"Post follow-up message".

Is that so difficult for you to comprehend?

> Aren't those inquiries are what shows you what the
> consumer is interested in?

Not necessarily. Sometimes. Sometimes not. I.....and
I alone....without your benevolent ASSistance will make
the determination. Do NOT feel compelled to assist me unless
and until I put you on the payroll.

> If a thousand people asked me about a mod for the 895
> I would definately consider working something up and putting it
> in my next book.

Well, sphincter-lips, let's take a look at YOUR first book,
first, before we go running off at the mouth about your "next"
one. In my case, when a thousand such inquiries come in,
I....and I alone....without your benevolent ASSistance will make
the determination. Do NOT feel compelled to assist me unless
and until I put you on the payroll.

I will, however, leave it to you to determine for yourself
what is best to do......for yourself. I should not desire
any opportunity to counsel you other than one simple
suggestion that you place it where the sun never, ever shines.

> Oops, I almost forgot, you don't give a damn what the consumer
> wants, just what YOU want.

Huh? There you go trying to do my thinking again when you
can't even think for your own pompous self. Geezus, Ignats,
how's about tending to your own britches....and the contents
thereof.....and get outa mine? To look at you gives profound
concern that you LIKE what you find there.......

> > Get outa my life, dude.
> >I'll give a hang when you pay me; but not as long as it's free.

> Well you will get your wish, old-timer. This will be my last reply to this
> thread and to you as you have wasted too much of my time.

Ooooohhhhhhhh gaaawwwwwwwwd, if ONLY that were true and I could
count on it. May I tell my banker in the morning?

> I'll fight with you when you pay me,

Methinks I've already paid you.......in spades.

> but not as long as it's free.
> Incidently, don't bother to ask if my "Unemployment" check will ever be spent
> on cheek trash, it's not even worth wiping with...

Cool. I really would hate for you to get cancer of the
rectum for wiping with paper that has carcinogenic ink.
My publisher is not one of the ecological savants of the
modern age.

> >especially for grubby, ungrateful, bony, booger-pickin >fingers like yours,
>> pal.

> I won't even justify this with a response...

Appears to me you just DID..........Slick.

> >I don't see YOU working 12-18 hours a day for the >betterment of the radio
> scene. Or for the betterment of >anything. for that matter....certainly not
> for free, *if* you >work at all....
> >And THAT is a big *if*........

> Do you REALLY call what you do "betterment of the radio scene"?

Me? Ummmmmmm..... well, I've been told a lot that's what I
do, so yeah, I feel that I have contributed immensely to the
betterment of radio. But my feelings counts less than my track
record. It's there. It speaks for itself. You can belittle it
all you want....which only serves to make me laugh....because
track records are a lot like the cards in the game of poker.
They speak for themselves. It doesn't matter what you call them.

I really would like to view your track record so it can speak
for itself..... but I can't find it anywhere. Would you please
direct me to it?

> I don't expect you to give your stuff out for free, but as a former
> customer myself, I do expect some courtesy which obviously you do not intend to
> give. Take heart though, when nobody buys your crap, you will remember all the
> people you crapped on and realize that they WERE your customers.

Sorry, Snake, but I don't *EVER* dole out the crap first. You
hitched up that humongous fat gut of yours and horsed out to fling
a little at me, and got some flung back at you for your time and
trouble. If it hit and hurt, that's your problem, pal. You shouldna
hadna oughta flung first. But since you did, you oughta be able to
stand the heat in the kitchen.

Write this down, Mindless One.....there ain't a man alive or dead
on this planet who can look you square in the eye and tell you I
smacked him first. And don't come sniveling to me about the
ones who can say I popped 'em second.

And don't swashbuckle and sachet around with this customer crap.
I don't play that stupid game. This forum ain't a store and
we don't do business here. If it's a thin line I have to walk,
then you'll damned well walk one, too, Slick. I don't do one-way
deals. You want me on the hot seat here? Cool, I can take it.

Obviously, you can't. And THAT is the problem, now isn't it?

/B

> $200 Range,....

Well, Radio Shack's PRO-2041 and PRO-64 (computer programmable)
are on sale for $199. Not only are they computer programmable,
but they have:

DISTINGUISHING FEATURES of the PRO-2041 and PRO-64

1. Four bandpass filters
2. AGC controlled RF amp
3. Double-balanced 1st mixer
4. Triple conversion
5. Computer programmable
6. 400-memory channels, expandable to 1600 or 6400 channels
by Bill Cheek's standard Memory Mods.
7. Preprogrammed Search Bands; 17ea
8. Monitor memories; 40ea
9. Direct freq search
10. Limit Search Banks, 10ea
11. Preprogrammed weather channels, 11 ea
12. Sorts scan freqs in a bank into a consecutive order.
13. Dupe frequency check
14. Auto store feature

But then you said "besides Radio Shack". You're not
going to match the above for $200 under any other brand.

Geezus, man, what do you expect? The FCC has a standing $20,000 fine
for violations of their rules. It would cost Universal $20,000 to
defend against such a fine, assuming they win; and $40,000 if they lose.

Look pal, control of the government isn't up to its victims. It's
up to those who empower it to victimize others......

Think about it.

Quite obviously they don't teach BSEE's how to read anymore.
You're not the first I've run into who is all jaws and no eyes
and ears.

Why don't you really READ what I told you, pal. If you can.

And cut the shit. BSEE's are getting mighty cheap these days.
You need to do better than that. (I was a BSEE when you were
scooting around in 3-corner shorts, Slick.)

You wouldn't like to address me as "Doctor", would you? If not,
then at least demonstrate that you can read and comprehend the
written word.

Guess what??? The local RatShak guy was unpacking an
order the other day when I spied what looked like old Pro-26
boxes mixed in with the new stuff. My guess was correct!!!!
ALL the RECALLED units are being shipped back out to the
stores apparently! The mgr said that he thought they were
discontinued and they needed to get rid of them. The price
was STILL $449 though! I later conned a droid friend into
opening up one and checking the innards to see what had
changed. It looks like they epoxied up the area around the
'magic' chip so you have to destroy it to get at it. :-(

>
> Hope this info makes better sense!

Yup. It's easy to get those little hummers mistaken. The silk-
screening isn't always that easy to read, either.

Okay, TC1 is the trimmer capacitor for the 6.4000 MHz PLL chip.
Its setting is fairly critical, I'd say.....the entire system
accuracy depends on it.

==========
The Service Manual has specific intructions for how to set TC-1:

1. Program 108.0000 MHz into a channel; select that channel.
2. Connect a frequency counter to TP-105 through a ceramic
capacitor (5 to 10 pF).
3. Adjust TC-1 so the freq counter reads 118.700000, +/- 10 Hz

This calls for a frequency counter with an accuracy of
1 part in 10^7.
==========

I would say you got a problem. But here is a "seat of the pants"
approach. Tune the scanner to a known good signal like a NOAA station.
Adjust TC1 while listening to the NOAA signal. Slowly tune TC1 all the way
around. There should be two points past which the signal gets to sounding
raspy and noisy, and before which, it sounds clearer and more pleasant.

Find those two points by rotating TC1. Then position it in the middle of
those two points on the side of the rotation where the signal sounds best.

The voltage at TP-103 at or near IC-101/Pin 9 should be right at 2.70v
when TC1 is properly set to a known good signal. Do NOT adjust
anything else under any circumstances.

This will, at least, get you close enough to enjoy scanning again.

>It is Christmas time and I decided to buy myself a Scanner. I would
>appreciate any and all comments about good scanners. Price is not a
>problem (yet!). I want to listen to everythig!! So a scanner that can
>take mods is preferred.

If by "everything" you include military aviation, citizens band and a few other things then you need to make sure the scanner tunes from 25MHz up to 1300MHz, including the UHF airband from 225-400MHz. It will also need to have manual receive mode selection. Generally, only top of the line scanners such as the Uniden 9000XLT base and 3000XLT handheld have these features. If you live in an area where the police are on a Motorola trunked system then you'll need one of the new TrunkTracker scanners, but you'll be giving up some of the other features.
If by "everything" you mean you want to violate federal law by monitoring cell phone calls then forget it. You'll get no help from me.

John

Metal case is one strong point. So is that tactile, sloping keypad, the likes of which has never been duplicated since. But the fingers can really fly on that puppy when you get it down. Your fingertip never needs to leave the pad; it can just slide around......fast!

The sloping front panel is great for vision, too. Also the larger, easier to see LCD display. The numbers are larger.

Then there is the space inside and the easier access to things. Lots of room in which to work and to add mods.

>The frequencies can be found via a search at www.DejaNews.com.

That ought to work. Being new to scanning myself, my own Quest for Information is fresh in my mind. Two things. First, I lurked here. Checked out the URLs in peoples sigs, and the ones that folks specifically posted. Second, I ran an Alta Vista (or was it Yahoo?) search on "Radio Scanner". That gave some more. Once I hit a couple, most folks link to most others.

Cordless phone frequencies pop up a lot. BTW, try looking in the 49 MHz band.

The Alinco DJX-10 will not be available within the U.S. until a couple of months from now because they tried to pull an "AOR AR8000", reportedly allowing the cellular band to be opened up through software. The only other options are the Icom R-10 and the New AOR AR8000B. Neither of these scan very fast (6 channels/second and 16 channels/second respectively). The AOR definitely beats out the Icom in terms of speed and senstivity. They both have great selectivity and interference rejection. While the AOR is a much more flexible (powerful) handheld scanner, its construction is very poor and the size is very large. The Icom, on the other hand, is second only to the Alinco in terms of construction and has a nice, pocket-size. The AOR AR8000 has a slightly longer battery life, not counting both scanners battery saving function. In my opinion, the Yupiteru MVT-9000, is probably the best of this class of radio. It has the features and sensitivity of the AOR 8000 and the construction of the Icom R-10. However, its interference rejection is much poorer than the AOR or the Icom. For more detail, visit Richard Well's website at <http://www.qsl.net/n2mca/RADIO.HTM>.

Racing Radios say to leave the antenna off the unit. The stubby ones
you buy are no better than having none.

Most of the teams are located in the 400 MHZ range. Only 2 or so are
up in the 800 MHZ region. This is according to my latest Racing Radios
scanner listing.

1. The FCC divides cell service by county among the A (non-wireline) and B (wireline) providers. So does A and B then resell to as many companies as the market will bear? The FCC lists four carriers in this zip code (GTE, Primco, ATT & Sprint PCS), but there are seven companies advertizing in the yellow pages in just my immediate vicinity.

2. Does an A carrier company buy _all_ the channels in a cell, or maybe a few in several cells? I notice some channels getting lots of traffic, and others never getting hit.

3. Are some channels set aside for other uses? Maybe channels exclusively for LEO (Law Inforcement), truck traffic only on one channel (along with the rest), and some just for digital (other than control channels)?

4. If you buy service from a B carrier, can your call only be made through a B tower and handed off to another B tower?

5. I read that most cells use OMNICELLS. Is this a _type_ of cell, or does it refer to the OmniCell company? Are there other kinds in use, and is the structuring significantly different?

6. A moving cell fon gets passed off to the next cell when it's signal drops below a critical level. Under what conditions does the fon hang onto it's cell while passing through another?

7. I hear of increasing system capacity by going to 10 Mhz spacing. Is this being implemented?

I would be interested in any references you can pass along.

1190. 895 computer plug?

Newsgroup: rec.radio.scanner
Date: 1997-12-12 00:00:00 UTC
From: John <#629371@att.net>
Message-ID: <66rc8k$m9h@bgtnsc02.worldnet.att.net>
Source record: 177697

Just got a 895xlt with expectations of hooking it to my computer, but there is no computer plug on the unit.

There's a little plastic plate on the back of the unit that says "remote", but no connector. The manual says computer control is possible (through third party programs), but offers no details on how to accomplish the hookup.

Have they changed the design? Did the 895 used to come with a computer plug, and now doesn't?

Any help is appreciated - Thanks. Here or Email...

John

Could you give us some examples (not necessarilly the tech stuff) of
what you have done?
As an Internet person with little real computer background, some of
this is a mystery to me. Frinstance...I do not have a clue what script
files are.
Not looking for an explanation...just some idea of what you can get a
scanner to do with them.

> Primco, ATT & Sprint PCS), but there are seven companies advertizing in the
> yellow pages in just my immediate vicinity.

The FCC granted 2 Licences per trading area to Cellular Companies (some
10-15 years ago). They operate in the 800 Mhz region of the spectrum.
Within the last few years 6 PCS licenses were auctioned for each trading
area. These companies operate around 1900 Mhz and use digital air
interphases. In addition there is SMR (i.e. Nextel). They operate
around 900 MHz. I believe there is only one license per TA (?)

> 2. Does an A carrier company buy _all_ the channels in a cell, or maybe a few
> in several cells? I notice some channels getting lots of traffic, and
> others never getting hit.

In areas of low traffic traditional cellular carriers may operate with
a reduced number of channels. Their license still allows them full use
of the frequency spectrum allocated by the FCC, to be broadcast within
the perimeter of the TA. CDMA PCS doesn't use "Channels"

> 3. Are some channels set aside for other uses? Maybe channels exclusively
> for LEO (Law Inforcement), truck traffic only on one channel (along with the
> rest), and some just for digital (other than control channels)?

In analog cellular there are signaling channels (i.e. for paging the
mobile, setting up the call, hand-offs) that are digital. Law
enforcement, trucks, etc. are on other freqs with simplex equipment.

> 4. If you buy service from a B carrier, can your call only be made through
> a B tower and handed off to another B tower?

Depends on the agreements between carriers. Generally possible, just a
matter of how money you are willing to fork over for the call.

> 5. I read that most cells use OMNICELLS. Is this a _type_ of cell, or does

Don't know

> 6. A moving cell fon gets passed off to the next cell when it's signal drops
> below a critical level. Under what conditions does the fon hang onto it's
> cell while passing through another?

With analog cellular - lots of static, eventually dropped.
Digital - dropped call
>
> 7. I hear of increasing system capacity by going to 10 Mhz spacing. Is
> this being implemented?

I believe N-AMPS went to 15 kHz spacing

>into
access. takes 5 minutes.

How impolite and rude!

Only works with the search program as supplied on the Regional CD's, not
Spectrum.

There's a number of ways to selectively import the records you want (State, or
any field). You can, from within Access, "attach an external table" to an
Access database. Simply attach the DBF file on the CD. Then you can create
queries of any sort that will run off of the CD. Slow, but cool, and no
importing required. Or, do that and then create an import query to another
table on your drive. Or, try the Microsoft Query plug-in. It can be activated
from Access or some spreadsheets. Beware upper size file limit (number of
records) with most spreadsheets, though.

On the other hand, the Regional CD has the all important tx city / licensee
city fields, and, you can make it's search engine export a file based on
geographic co-ords (Lat/Long), something that's a little tricky from within
access, unless you really know your queries! If you have the regional CD an
EXPORT from it's search engine IS faster than using access. A big state can
take hours and must be rough on the drives. A new, faster CD rom drive will
help a lot.

Dont forget about those pesky itinerant and mobile only licenses that have "US"
in their state fields, if you want those, too. Last time I checked there were
over 60,000.

1196. Re: Pro-2004 repairs?

Newsgroup: rec.radio.scanner
Date: 1997-12-12 00:00:00 UTC
From: tandkmoran@aol.com
Message-ID: <19971212133600.IAA24843@ladder01.news.aol.com>
Source record: 177703

2004's are getting long in the tooth. Not all parts are still available, even for the tandy repair center. They do a good job finding substitutes, but for some of the parts - there aren't any. It's too bad, I think this was one of the finest scanners ever produced, especially for urban scanning. When I had my store I got variable reports about tandy repairs on mod'ed 2004's. Sometimes they rejected the radio because it had been mod'ed. Many other times they un-did the mods. There is some justification for this - if you read your warranty or your extended service contract they are legally required to service the radio until it's returned to it's original specs.

Mine died recently. Sometime when I have a whole day to kill I'll take another whack at it with the soldering iron / tweezers / hammer. My plan is to un-do ALL of the mods and re-solder ALL of the connections and see if that helps any. I've already replaced the audio amp chip once, along with it's associated supply parts. (It's okay when first turned on, but after a while the audio starts clipping, then it keeps scanning over active signals, then it keeps scanning with the squelch wide open - not so good). Too bad, too, because I had just fitted it out with a scanner-master EDACS tone killer board and it was working bo-fine.

Note - These were notorious for bad quality control on the solder joints. I'm on my second mother board with this radio. I repaired about a dozen solder joints on the first board, and another 20 on the second. If you are handy try pulling the mother board, turn it over and carefully inspect all the solder joints on the back of the main circuit board. Look for cracked or loose solder joints and carefully re-melt any you find with a grounded tip iron. G&G Communications in Leroy NY still works on them, but the last time I checked they too were having some trouble finding some of the parts and they were back logged by about 4 weeks. (They are a great outfit, however!). Good luck and happy scanning.

Hey Jim,

Firepage Columbus is a membership group that consists of various fire buffs and active dispatchers (some firefighters too) that like to hear about working fires in progress. When a fire is called back as a working fire, numerous dispatchers send out a page on a provided alphanumeric pager ($10 a month for the pager.... its really a GREAT deal!!!) listing the building layout, location, and responding engines, ladders, and medics. It is a pretty cool group! I have been a member and recieving pages for about 4 months. I couldn't be happier with the service! Let me know if you are interested, I will give you some further info.

Todd,
The tones that
you here trip the paging units for the various departments, for instance we have a four tone group. The first set trips our home pagers and the second set trips the alert units at the stations.The tone are different for each dept. that way only the district involved gets the call, if we arrive and then need help we call dispatch to hit the closest departments tones and ask for aid. Steve

Article Reprint from August 97 Monitoring Times Page 72
"The World of Ham Radio"
A Gem of a CD
Ike Kerschner, N3IK

Have you ever stumbled onto something truly valuable? Remember the surprise, the thrill? You can experience that same feeling when you examine a copy of the CD-ROM software by AMSOFT called "The World of Ham Radio"! This is one of the best bargains I have laid my hands on in a long time.

This CD has been around for a few years, and I have seen it for sale at several hamfests. Several years ago I looked at it and felt the CD provided a decent call book with some nice software.

The latest copy, however, knocked me over! I held a copy of it for several weeks before giving it the once over, but after I started I couldn't stop. Programs that I had on separate disks were available to me in one location with an excellent menu, and moreover, they would run directly from the CD. For many years I have collected shareware at the price of 2 to 6 bucks a disk, finding many I liked but a lot more that were just ho-bum. If I were to add up the cash laid out to come up with a handful of decent programs I am sure it would be several hundred dollars.

"The World of Harm Radio" is a collection of excellent software, in fact, almost all of the programs I have chosen over the years as being the best are on this CD, plus a lot more, to boot. All of this and a call book, too! Looking up a call is a snap in AMSOFT's "World of Ham Radio." But, let me give you a brief tour of what else is on this CD.

When you type CDVIEW, a listing of many different subjects is presented to you. Choose "Antennas," for example, and you will find 26 different antenna programs that will provide full information on a host of antennas, from simple long wires to yagi and complex loop antennas.

"Basic programs" are a wide range of simple programs written in BASIC which will run directly from the CD. Examples of the Basic listings vary from antennas to z calculations.

Twenty-six different programs deal with Morse code - from learning programs to programs that will allow you to send Morse from your computer keyboard as well as copy code via the computer and shack receiver.

A variety of engineering programs are included, among which are a a simple-to-use CAD program for drawing schematics, a program to lay out PC boards, and tools for designing specific circuits.

Eight different logging programs give you anything you want for contest logging, general logging, and certificate hunting.

One program I particularly like is a training manual for the oscilloscope. As you go through the Oscope manual the computer shows demonstrations of what will appear on the screen of your oscilloscope under different testing situations. Last Christmas a good friend wanted more info on using an oscilloscope and we spent several weekends going over the use of the instrument in my shack. If we had this program, I am sure my friend would have learned a lot more a lot faster.

Equipment modifications also are included on the "World of Ham Radio" CD. I examined all of the mods available on the CD and am anxious to try several, especially one for a scanner I have. Not every piece of equipment is covered, but there is a lot!

Eight propagation programs allow user to determine the best time and frequency to work various parts of the world.

Included are 36 packet programs from very simple to very elaborate terminal programs, information on using packet, and circuits for various packet projects. If you ever wanted to try RTTY, 10 programs on this CD will let you get your feet wet in this interesting mode with minimum outlay.

A very interesting listing for satellite comm- unications provides info on operating and tracking programs, again from simple to fairly complex. There are several programs for SSTV and WEFAX that I am just now beginning to explore.

As always, there is a "Miscellaneous" listing containing 89 programs which I have only begun to explore. There is also a question and answer section that deals with many subjects, Scanner buffs and SWLs will find a lot of good information on this CD: frequency lists, data bases, modifications, and more.

In short, "The World of Ham Radio" gives you hundreds,
if not thousands of dollars worth of information on ham radio,
and all at a price of $29! If you have a CD drive on your
computer, grab a copy ASAP. If you don't have a drive,
consider putting one on your machine just so you can
use this super CD.

Ike Kerschner, N3IK

Scripts for the CE-232 Interface are micro mini little
command sets (programs if you will) that make the scanner
act, react, and perform just like we would do if we were
sitting there. Except that it's faster and more accurate
than we could ever be. Here is an example:

```
==========================
/ demo3.scr
/ demo of some entry types
chan = 55
freq = 57.90
delay = on
lockout = on
pri = off
pause 10
search up
==========================
```

This script selects ch-55 and programs 57.90 MHz in
it; turns the DELAY on; LockOut on; PRIority off; pauses
for roughly 10 seconds, and then initiates a SEARCH up
from 57.90 MHz.

This is just a demo, and scripts really can go hawg-wild
to do just about whatever you want to do, given a set of
conditions.

Hi...I have a Bearcat 200xlt scanner, that I really like a lot! However it's broken....it receives nothing anymore, and I don't know where to send it. I'd like to send it to get it fixed, but dont' know if Bearcat is still doing it or what. I don't want to spend what amounts to the cost of buying a new one, and I don't want to send it out to have it be gone for 6 months either. If anyone has any ideas I'd sure appreciate hearing...
Thanks
Jim

I also like the ability to create script files. I've been pretty much able to make my PRO-2006s do anything I want with script files. Myself and a few friends who also have the PRO-2006/CE-232 setup have had several brainstorming sessions to come up with new things to make the scanner do and I can't remember even one 'reasonable' idea that we couldn't get working in script.

I have 2 cordless phones and I would like to know what frequencies they operate on. The first one is an AT&T model 5352 and the second is a Uniden 9200. I'm more interested in the AT&T model. Being a scanner buff I tried to find the frequencies myself. I tried the 900-950 range first with no luck. I figured I would be able to at least hear a strong carrier signal even if it is digital. No luck. I even checked the 30-50 Mhz and 420-512 Mhz range. Still no luck. I did hear a faint beeping signal in the 39.xx Mhz range for the Uniden. Does anyone know the frequencies for the following Phones. If I had the frequencies could I listen to the conversations? Will I need a digital to analog program to descrabler the signal? Any help would be much appreciated.

I have the frequencies that you want, however I think this is a great learning opportunity for you to find them yourself. You may want to look for a digital-to-analog conversion program. I might have a great one (free) however finding one yourself will add to your educational experience. These phones use different frequencies than most phones, and the technology incorporated is not exactly new, but hardly outdated. There is a trick to finding them, namely the step, mode, volume, antenna length, distance, earphone settings and frequencies must be precisely set. Figuring out which among the array of parameters you require will be another educational experience for you. All of us in this newgroup are hoping that you will overcome your "challenge" and be successful in this endeavor. Each of us has struggled with our radios, and come out the better and wiser for our efforts. It's up to you to rise, rise, rise and become the radio expert you know deep down you can be. There's a saying among scannists: "Listen to the world and you hear your own heart beating". No doubt you've heard it before. It rings true with you as much as any of us. You CAN become. You can learn. It takes time and a dedication, and that "willingness" to not let a challenge defer your good intentions. These phones you want to understand, they gnaw at your mind, I know. But they are echos of the future "you" calling; they are beckoning you forward, to that place and time where you will be all you can be. Listen to that voice. It is your friend. it can do you no harm. And, if you have any questions, feel free to post them in this newsgroup.
-Emilio

There is one use of preamps that I haven't seen mentioned here. I have a brick home and I'm not too keen on drilling a lot of holes to bring in numerous runs of coax. After looking at the options, I was able to minimize the number of cables into the house. I have several cables that come in for the ham radio equipment so I limited the number of scanner cables to just two.

The first scanner antenna is the one I use with my 'prime' scanner. If there's any signal to be heard I can here it on this one. I have a JIM M75 preamp in a weatherproof box right under the antenna. After the coax comes into the house it goes through another JIM M75. Neither of these are adjusted for maximum gain but I can adjust the one inside to suit my needs. This feeds an ICOM R-7000.

This left me with a lot of scanners still in need of an outside antenna. So on my second scanner antenna I have another JIM M75 mounted at the antenna and also a second JIM M75 inside. From this one antenna I feed 24 additional radios. I use splitters rated for 5-1000 MHz sold by MCM. Also from MCM I bought some of the bullet amplifiers and rebuilt them using MMIC chips. After the JIM M75 I have a 3-way splitter with a bullet amp on each output. Then each of these outputs go to a 2-way splitter with a bullet amp on each output. Then each of these outputs go to a 4-way splitter with each of the four outputs going directly to a scanner. This gives me 3x2x4=24 connections with a good signal to each radio. This setup gives me nearly the same signal on all of these radios as I have on the R-7000 at all frequencies up to 1000 Mhz or so. Not something I could accomplish without some amplification.

While I wouldn't suggest this for someone living in an RF rich environment it works great for me. (By the way, if you weren't counting, that's 11 preamps on one antenna, and it's stable.)

Amplification for distribution is a well established practice. What distinguishes your application from the body of applications posted here, is that yours is well thought out, and designed for not only your needs but also your environment. The bulk of preamp applications are in the effort to repeal the laws of physics and manufacture sensitivity in the presence of a poorly designed installation.

A lot of operators are not using a multiple outlet distribution system, and for them, at least the bulk of them, a quality ,passive antenna/transmission system into a R-7000 is more than adequate to bring the system to its limits of performance.

For Sale
ICOM R-10, mint condition (no cellular)
Purchased about 2 months ago (from Grove),
hardly used

includes these options
OPC-478 Cloning cable
LC-140 Carrying case
CS-R10 cloning Software

Groves price for this package is about $580

will sell entire package for $485.00

I'm sure someone will correct me on this if they know more on the
subject...but since the radios were mod'd by the original manufacturer
and there was nothing wrong with them(no components, etc. were
removed, added or replaced; which is the definition of refurbished),
I believe it is perfectly legal to sell them as new. They also
have never been sold nor inoperative/malfunctioning at any time.

> > this way and save LOTS.

True...but the odds of such happening are pretty low as far as I am concerned if you consider all the radios, accessories, books, etc I have purchased this way.

That's also why you use a credit card to have your bank resolve and difficulties that may arise. I've had more troubles buying in department stores, getting a car serviced, etc...by far.

In the past year I've probably made about 50 mail order purchases and only had two difficulties. One was where the previous edition of a book was shipped instead of the most recent. The other was when a radio was suppossed to have been shipped but then the dealer found they were out of stock due to it being discontinued with no more units available. Both situations were resolved within about 3 minutes on the phone.

I compare these two "hassles", if you can call them that, to the large amount of money I have saved and it's a no brainer as to how I'll do business in the future.

Hmmm... is the alpha pager also capable of getting alpha pages from
other people who aren't interested in fires? Or, can you use your own
alpha pager and just get the pages on it?

Color me interested, and send info too if ya can. :)

For more information on FirePage Columbus (FirePage Ohio), go to http://members.aol.com/slewis3091/fpc/. FPC is a member of IFBA. Firepaging services are available in many cities around the country, and has many FFs are involved with the services. And there is a difference between ambulance chasing and getting info on a working fire (the service is primarily for fire buffs). It is kind of like having a text version of your scanner, for those moments when you don't need or can't have a scanner with you.

>1. The FCC divides cell service by county among the A (non-wireline) and B
>(wireline) providers. So does A and B then resell to as many companies as
>the market will bear? The FCC lists four carriers in this zip code (GTE,
>Primco, ATT & Sprint PCS), but there are seven companies advertizing in the
>yellow pages in just my immediate vicinity.

The original 800MHz cellular system has two bands, A and B. Each operator may use only channels in his assigned band. PCS, in the 1.9GHz range, has 5 bands, three wide and two narrow. And Nextel have their own system. So, you could see at least 8 vendors in each market, plus the divers vendors who 'buy' services from operators. Then when Iridium comes on line, you'll have yet another vendor.

>2. Does an A carrier company buy _all_ the channels in a cell, or maybe a few
>in several cells? I notice some channels getting lots of traffic, and
>others never getting hit.

An operator builds as many cells as needed to provide at least adequate radio coverage in the geographic region. He does have all the cells in his band (A or B).

>3. Are some channels set aside for other uses? Maybe channels exclusively
>for LEO (Law Inforcement), truck traffic only on one channel (along with the
>rest), and some just for digital (other than control channels)?

Nope. The cellular system may be programmed to give emergency calls a higher priority, but no channels are really 'reserved' or any particular use.

>4. If you buy service from a B carrier, can your call only be made through
>a B tower and handed off to another B tower?

Generally yes. If you are travelling in one operator's area, your calls will
only be handed over to another cell in that operator's system. When *leaving*
a particular area, you may or may not hand over to another system; it depends
on the agreements the operators have with each other.

>5. I read that most cells use OMNICELLS. Is this a _type_ of cell, or does
>it refer to the OmniCell company? Are there other kinds in use, and is the
>structuring significantly different?

Cells in rural areas may tend to be omni-directional. However, cells in urban
areas are more and more becoming sectorized, with three to six sectors per cell.
(In GSM, a sector is logically another cell.)

>6. A moving cell fon gets passed off to the next cell when it's signal drops
>below a critical level. Under what conditions does the fon hang onto it's
>cell while passing through another?

With a good digital system, the MS sends quality and signal strength reports to
the cell. The system is also collecting quality and signal strength measurements
on the call, and will use both sets of reports to decide what to do with the call.
If the new cell's strength is better, but the quality is poor (perhaps caused by
interference), the system may choose to leave the call on the existing cell, at
least until conditions change. Analogue systems traditionally relied solely on
the systems measurements, as the MS had no means of sending reports up.

>7. I hear of increasing system capacity by going to 10 Mhz spacing. Is
>this being implemented?

N-AMPS changes the channel width from 30KHz to 10KHz, although one or two
countries only went to 15KHz. GSM uses a 13Kb voice channel; there is the half-rate
part of the spec, but few operators really want to go to it, because they would
have to swap out all of their customers' mobiles, and because they're finding
the voice quality just isn't good enough.

For increasing system capacity, non-US GSM operators are switching to dual-mode
systems (both 900MHz and 1800MHz). With dual-mode phones, users will be able
to use both bands, and the system will be able to hand mobiles over from
one band to the other in order to balance the load, thus ensuring better
performance for the cellular users.

I don't know if the domestic US market is planning anything like this. Domestic
GSM is only operating at 1900MHz. I suppose CDMA and IS-136 (US TDMA) systems
could do this, as they run at both 800MHZ and 1900MHz.

Hope this makes sense....

>Could you give us some examples (not necessarilly the tech stuff) of
>what you have done?

Here are two quick examples but if you can think it you can pretty much make
the radio do it.

I have one script file that allows me to link multiple search ranges. Some of
the newer scanners already allow this but the PRO-2006 doesn't. So for example
I can now search sequentially through 154-157 & 453-454 MHz.

Another one allows me to temporarily lock out one or more channels. The
script will check each locked out channel with a specified range (ie channel 1-27)
and if there is no signal it will unlock that channel and continue on scanning.
This allows me to lock out idle chit-chat that I'm not interested in listening to
but I don't have to remember to go back and unlock the channel later. The
script does that for me as soon as the channel becomes inactive.

Rob,

The CB band is 26.965-27.405 MHz. My theory of why the lower limit of most scanners' coverage ends around 29 MHz is that everything below that (CB, shortwave, AM broadcast band, etc.) uses amplititude modulation, and nearly everything above 29 MHz is FM narrow. I guess it would cost too much to add more AM circuitry for just the CB band. Some scanners have full coverage all the way to the AM broadcast band (0.53-1.71 MHz) and below, so these obviously will pick up CB. My Yupiteru 7100 is one of those full coverage radios, and I've been listening to the local ratchet-jawers on the CB band for the past hour. It's fun to do, but each time causes the death of millions of brain cells. The surgeon general has warned that too much CB listening could even cause a person's intelligence level to drop into the democrat zone. Trust me, Rob... no one wants to go there!

Happy scanning.

While wondering the Radio Shack aisles, avoiding the radio controlled cars
flying all over the floor, I looked at that antenna and thought the same
thing -- it's the Scantenna.

However, when I verified with the droid working at the counter, he said that
there was _not_ 50' of cable included, that it was a misprint.

He could be wrong, but check before you jump. Seems like a good deal either
way.

mmmm....your reply was to HIM? A simple suggestion that will help prevent clogging this group up with meaningless twaddle...email. Its a feature that enables you to send your reply directly TO HIM without subjecting the rest of to your views on life. If you are unfamiliar with email, I am sure that someone would be delighted to help you. Without the attitude.

Have a really meaningful day.

1259. BC 120 XLT mods

I'm sorry if this seems old to you all, but I was wondering if there are any known mods for the Bearcat 120 XLT scanner, particularly in the 800-930 MHz range. Please let me know, I am desperately trying to find some!

dave

Duh! Quantity wise, you have posted more antagonistic posts to the scanner groups in the last two years than all the other participants combined. Just the kind of hypocrisy you like to use to obscure the fact that you are the main irritant here and always have been.

< snip >

> It has continued as Glenn Hansen, 3MTA3, Kendrick, & a few others
> have tried their best to "fan the flames".

You're just irritated because there are people in the scanner groups that won't put up with your idiotic rantings and general stupidity and have the ability to tell you so.

> I urge you all, especially those listed above, to STOP this
> behavior, IMMEDIATELY. PLEASE, lets keep this NG a nice
> place & not allow these trouble makers to cause any more
> trouble.

More hypocrisy Toilet Boy. Forget to take your medication again? Take your own advice, bozo.

> Lets help keep the radio hobby a clean respected hobby.

It's cretins like you who give humanity a bad name, let alone hobbies like ham radio and scanner listening.

Wasn't talking about a specific frequency, only the receiving range of
the target receiver. Over the passband, 75 ohm coax with still be
useful when mated with a nominal 50 ohm receiver antenna connection.
That's what I've said all along. You're just too obtuse to see the
point.

> Even then, I doubt you have the technical knowledge to really track
> the matters.

Didn't miss a thing. When you post lame and downright wrong information
as you did, it's you who show your limited technical ability.

> You would do well to listen to your own words:
> "So far you haven't engaged in much conversation, only oral vomitting."

Lets see, considering the voluminous number of posts you've made over
the
last two years slamming Bill Cheek (strictly out of pure jealousy and
spite
because he can do it and you can't), and telling anyone who disagrees
with
you they are a fool and must be new to the internet, you should
reexamine
who is engaging in conversation and who is spewing bombast.

Actually, CB is 26-28Mhz. Legally from 26.965-27.405, illegally from
26.0-28.0. The PRO-2006 will cover it, as will most AOR models.

Buy the base. I recently had both laying out on the counter at R&R communications in Delaware and I really wanted the features of the base but portablility was a bigger factor. Even though the base can run off of a lighter adapter it is not design to just grab & go. The portable does not have CTCSS as well as a few other nice features. If grab & go was not a factor I definitly would have bought the base.

Thank you for all this info, Neal - it is very interesting. I had a couple of minor comments, though.

Neal P. Murphy wrote in message ...
>For increasing system capacity, non-US GSM operators are switching to dual-mode
>systems (both 900MHz and 1800MHz). With dual-mode phones, users will be able

I believe these are called "dual-band" phones rather than dual-mode, which implies GSM+AMPS.

>to use both bands, and the system will be able to hand mobiles over from
>one band to the other in order to balance the load, thus ensuring better
>performance for the cellular users.
>
>I don't know if the domestic US market is planning anything like this. Domestic
>GSM is only operating at 1900MHz. I suppose CDMA and IS-136 (US TDMA) systems

Are you 100% sure all US GSM carriers use 1900 MHz? I thought some used other bands? Also, on your previous point, I believe Ericsson is implementing a 1900 MHz GSM network in Stockholm, Sweden with Telia. This is to kill two birds in one stone: increased bandwidth for existing non-US GSM networks, and compatibility with US phones. It would allow US GSM users to roam to non-US GSM networks without switching phones.

>could do this, as they run at both 800MHZ and 1900MHz.

Hi all!

In NSW Australia, we now have a (Motorola?) trunked radio system. But its not on the 800 MHz range, its on the 400 MHz range. I've been told that the new bearcat trunk scanner only works on he 800 MHz range.

Any info please? Or has someone successfully used a computer (DOS or windows) with some other "normal scanner" to operate over trunks properly? Would appreciate any reply by EMAIL rather than via the group as sometimes have trouble getting the group.

Many thanks

1288. TALK GROUP LOCK-OUT PROBLEM

Newsgroup: rec.radio.scanner
Date: 1997-12-13 00:00:00 UTC
From: baxter@kuhub.cc.ukans.edu
Message-ID: <1997Dec13.123252@kuhub.cc.ukans.edu>
Source record: 177472

I have just gotten a BC895 trunktracker, and the unit appears to
be quite sensitive, and does just what the BC235 does, but with a lot
more volume for easier listening.

HOWEVER, after programming in several trunked systems, I tried to lock-out
some unwanted talk groups... and the radio said FULL.

I tried to see why the lock-out funtion was FULL, by holding down on the
L/O key for two seconds (this displays all the groups that are locked-out),
but the radio did not display anything in the lock-out mode.

So, the question is: Why is the talk group lock-out full, and how can it
be emptied so the radio can actually store unwanted talk groups?

Thanks

> I would like to buy a copy of the pro-43 service manual not the owners
> manual. Thanks DAC

It appears that Tandy has "loosened" up on the
availability of older service manuals, including
that for the PRO-43.

It's a free call to find out: (800) 442-2425
Give 'em the catalog number of the PRO-43 (20-300)
and ask for the Service Manual.

If that doesn't pan out, contact me privately
for other alternatives.

1291. RS Service Manuals

Newsgroup: rec.radio.scanner
Date: 1997-12-13 00:00:00 UTC
From: Robert Walker <rwalker@iamerica.net>
Message-ID: <3492DC27.BE9920B@iamerica.net>
Source record: 177475

Below is a copy of the email I just receievd from RS ragarding

availability of Scanner Service Manuals.....

Subject:
RE: Scanner Manuals
Date:
Sat, 13 Dec 1997 12:24:46 -0600
From:
RSPSC1 RS Store POS Mail user <RSPSC1@Tandy.com>
To:
rwalker@webzone.net

Early in 1997, representatives from industry, including RadioShack, met informally with the FCC to discuss current problems in the scanning hobby. Identified as a major problem was the ability of some scanner hobbyists to develop illegal modifications that allow scanners to receive cellular telephone transmissions. Among the possibilities discussed for eliminating this problem were the total epoxying of all circuit boards, which would render scanners both unmodifiable and unserviceable, or the restriction of technical information regarding scanner circuit design.

As a result of this meeting, Tandy limited the availability of scanner service manuals to Tandy Service Centers only.

While Tandy understands the desire of the do-it-yourself community to have easy access to service information, we feel the interests of the scanning hobby as a whole are best served by making it more difficult to

develop illegal modifications by restricting access to some service manuals containing schematics. Therefore, in response to industry concerns, Tandy is implementing the following policy in regards to the release of service information and the servicing of scanners.

Tandy (RadioShack and TechAmerica) will withhold schematics (service manuals) for all scanners that can receive 800 MHz or above which were submitted for FCC certification after April, 1997. As of December 12, 1997, this means that service manuals for the following RadioShack scanners will not be available: 20-417 (PRO-2048), 20-430 (PRO-2050), 20-512 (PRO-67), and 20-520 (PRO-90), along with all future service manuals within the stated criteria.

To the extent that service manuals exist and are in stock, schematics (service manuals) for scanners that can receive 800 MHz or above that were submitted for FCC certification before May, 1997 will continue to be available to customers and others.

To the extent that service manuals exist and are in stock, schematics (service manuals) for scanners that cannot receive 800 MHz or above will

continue to be available to customers and others.

Modified scanners (regardless of frequency or date of manufacture) will not be serviced by Tandy. These scanners will be returned to the customer with a notice indicating that the unit appears to have been modified and if the scanner is returned to its original specifications, Tandy will use reasonable efforts to repair it.

To the extent that scanner parts are available and in stock, scanner replacement parts will continue to be available regardless of the scanner's frequency range or date of manufacture.

Schematics and technical information is available in the Service Manual.

You should be able to obtain a service manual from Tandy National Parts.

The address and phone number for Tandy National Parts Warehouse is:

National Parts
600 Tandy Technology Center
Fort Worth, Texas 76102
Phone: 800-843-7422
Select option 3 Catalog, Part and Accessory Order
FAX use: 800-821-1959

blade@cts.com (Robert) wrote:

> Bill has rendered a short sighted, cynical opinion on the "Yupi". Yes
> it is not avalible in the U.S., but I think most people seek out
> these units because of their excellent qualities, not because they are
> "illicit"

No, sir, it is not a "short-sighted opinion". It *is* one facet of a very large picture, and that one facet is as valid as any other. A tree has "bark" but that does not make it a "dog". Nor is it shortsighted to discuss the bark of a tree. Nor that of a dog.

The fact remains....because the Yupi radios are illicit, there is little or no support for them in the USA. You can't even get a service manual for them, and woe be unto the poor sap who gets a Yupi that craps out. That's another facet.

Another one still is that the Yupi cannot possibly comprise any reasonable facsimile of a "market" here in the USA. But a "market", especially a legitimate one, fosters and promotes not only the betterment of the product, but also of the hobby and community that uses the product.

Ownership, possession, and whooping up the illicit Yupi radios only serves to irritate our Congress Critters and the Friendly Candy Company (FCC) .....who then add insult to injury by creating MORE....not less.....laws against our hobby. There's one more facet for you, pal.

Another one, if I may......is the monetary support (read VOTE!) for a company and a product that does not care to submit itself to the "certification" process so as to gain that legal standing. So the Yupiteru company and its people lurk offshore, sucking off US dollars that will never turn around and add anything to the USA market and hobby.

No, sir.....my offering was NOT at all "short-sighted". To the contrary, it was rather long-sighted and far-reaching. I could even continue with more of this insight...and will, if you tempt me.

> Bill, can you direct all of us to a better handheld scanner than the
> Yupi-7100 or the 9000 for 300 - 400 dollars blocked or not? If so I
> would like to know about it.

THAT, sir, quite depends on what it takes for you to call it "better". I cannot possibly read your mind. But I will venture to submit that the new PRO-64 can outperform the best of the best of the Yupi's in terms of basic receiver specifications: sensitivity, selectivity, resistance to intermod, spurious, images, desense, overload, RFI, EMI, phase noise, etc, etc, etc. The PRO-64 is on sale right now for $200.

Another is the PRO-43, gone from the shelves now. Another may be the Uniden BC-3000....or the older BC-2500. Any of these will outdo the Yupi's in receiver characteristics.

Do they have cellular? No. But then analog cellular is almost a thing of the past anyway.

But I don't know what you mean by "better". I do know that in order to get a Yupiteru scanner into this country, it has to be smuggled in. Smuggling is the world's second oldest profession. And it is illegal. And it is destructive to the larger picture. And you COULD get into some very serious trouble for your efforts. Not only that, but you COULD be directly responsible for someone else getting into serious trouble if they listen to you and act on your recommendation. Don't be a fool, fella.

If you are gratified by smuggling, then more power to you. I do not pretend to suggest what is right or wrong for YOU. But let's do be TRUTHFUL and tell it like it is. Buying Yupiteru radios is not good for the scanner community as a whole; nor for our country, even though it may be good for YOU.

It could land the next man in jail. Or even you for publicly 'fessing up that you're a smuggler. And then someone else will have to take care of your family.

I do not believe my prior post was shortsighted at all, Mister Blade. But I do believe yours was shorter than your whatchamacallit, if you catch my drift.

Eh? :-)

1293. Re: TALK GROUP LOCK-OUT PROBLEM

Newsgroup: rec.radio.scanner
Date: 1997-12-13 00:00:00 UTC
From: Bill Crocker <billc@rust.net>
Message-ID: <66umq9$enu@oxy.rust.net>
Source record: 177477

This is a known, but minor problem that occasionally happens. All that's needed to clear it, is to do a factory reset. I'm sorry, I can't recall what that sequence is, but it involves turning the radio OFF, then holding down a couple different keys, while you power the radio back ON. This of course clears ALL your programming as well, but it should be o.k. after that, and not require it to be done again, from what I understand.

Maybe someone else will come up with the reset sequence. It wasn't included in the manual I have. Possibly the sequence for earlier models will work with the BC895?

Good luck,
Bill Crocker

p.s. Please let me know what that sequence is when you find out. Never know, I might need it too! Thanks!

Let's see, you among other people, have been beefing that Mackey has only posted 1 scanner-related message in 1000. You on the other hand, have never posted a single scanner-related message in probably 300. So why are here? Do you, or do you not, have anything to say about this hobby?

Yes, you can call me Mikey. All the girls do.

Michael Alexander

Oh Lordie! The last two radios I sent to Tandy's service people were eventually destroyed by them. One went back and forth four times, being returned to me in worse shape each time. I finally had to junk it (DX-302). Apparently their service personel are on same skill level as their sales people. (Ask one what a PL-59 is) A possible exception is personnel in a franchised store.

Resembles the BC895XLT I tested in December 1997 Monitoring Times --
it arrived in a bewildered state from the factory.

You need to reset the scanner, though this will clear your BC895XLT's
memories:

1. Turn off the scanner
2. Press and hold the 2, 9, and Manual keys while turning the power on.
3. Wait a few seconds.
4. Release the keys.

See Dec 1997 MT for more BC895XLT tricks, techniques, and
technical test measurements.

Frequencies for the NASCAR teams and officials are in a lot of places.
Uniden (http://www.uniden.com) has a list that includes WC, BGN, ARCA,
NASCAR officials and some of ISCs.

The "Police Calls Plus" book RS sells lists frequencies for race tracks.
They're organized by state and type of service.

Someplace good to look is http://www.li.net/~j4dice/stateidx.html.
Download the Georgia file and search/browse through it.

OK flamers and Jailhouse lawyers. Now that there has been some question
as to the propriety of selling the PRO-26 as "new" consider the
following which applies in California:

Business and Professions Code, Division 7, Part 3, Chapter 1, Article 2,
Section 17531 states -
It is unlawful for any person, firm, or corporation, in any
newspaper, magazine, circular, form letter or any open publication,
published, distributed or circulated in the State of California or on
any billboard, card, label or other advertising medium, or by means
of any other advertising device, to advertise, call attention to or
give publicity to the sale of any merchandise, which merchandise is
secondhand or used merchandise, or which merchandise is defective in
any manner, or which merchandise consists of articles or units or
parts known as "seconds," or blemished merchandise, or which
merchandise has been rejected by the manufacturer thereof as not
first class, unless there be conspicuously displayed directly in
connection with the name and description of such merchandise and each
specified article, unit or part thereof, a direct and unequivocal
statement, phrase, or word which will clearly indicate that such
merchandise or each article, unit or part thereof so advertised is
secondhand, used, defective, or consists of "seconds" or is blemished
merchandise, or has been rejected by the manufacturer thereof, as
the fact shall be. Any violation of the provisions of this section
is a misdemeanor punishable by imprisonment in the county jail not
exceeding six months, or by a fine not exceeding two thousand five

hundred dollars ($2,500), or by both.

I was not able to find a clearly stated definition of "seconds" or "blemished". This is apparently left open to case law interpretation. We do know for a fact that these units were not acceptable to the manufacturer as built and were later modified.

I'm thinking about ordering the RS Pro-26 from www.grove.net; I'm just
curious if these are used/refurbished models they're selling or what,
because I can't figure out any other reason they'd be so much cheaper
than buying new from Radio Shack. ($450 vs. $250) Also, if anyone can
vouch for grove being a reputable business etc, I'd appreciate that
alot too... I haven't done business with them before and just wanna be
careful.

Thanks very much!

Radio Shack is brilliant. They had a few periodic sales of manuals. How could they increase the demand? What better way to create a demand than to take the manuals off the market and subsequently allow their sale.

How many of us will buy a manual now that they might be available, just in case they are subsequently taken off the market again? This could be the greatest marketing ploy perpetrated by a company since the great Coke, New Coke, Classic Coke ploy.

Radio Shack has taken what was mediocre market and created a buying frenzy. What a plan! I'm gullible. I still drink Coke and will try to buy a manual.

> with the BC895?

You are correct in using the reset on this to fix the Lock-out problem.

Bob Parnass replied to me also indicating this was the way to clear
this glitch. The key sequence for a hard reset is to hold the 2,9 and
manual key together and turn on the radio.

Bob mentioned that this same problem occured with the BC895 that he reviewed.
If this is a common problem (even if it is not), I wonder why Uniden
doesn't mention how to reset the radiio in case of software glitches.
Seems like they would save a lot of hassles on their 800 number from
consumers.

Hi once again,
Just finished installing my Radio Shack scantenna clone, #20-042, on sale for $29.99 from $39.99. I went back to the store and mentioned the fact that the catalog said it came with 50' of cable but there was indeed no cable in the box. The guy at the store gave me 60' of RG-8 for free!!! Wasn't that nice of him?? I thought so. So I went up on the roof just like Santa cause it was snow and ice covered, attached it to my existing TV antenna mast, ran the cable and here I am, listening to scanner stuff with beer in hand with much better reception. So far so good but I need to see what it sounds like in the long run. Now if only the Pro-64 had better audio, Oh well, can't have everything. I have picked up some Conrail stuff already that I've never heard from my house yet. This should be the last of my scanner investments for a long time (I hope).

Thanks for all your input and suggestions and yes, Rich is the king of scanners!!

Correction on two points: I am not involved in the latest argument(s) about John's relevant posts. You are confusing me with someone else. I have in fact posted scanner related messages. I have posted regarding Pro-51 scanners and antennas and probably a few other things. If you do not think my relevant post/other post ratio is high enough than shoot me a number *and* cite the authority and I will be happy to comply. I have asked you in the past how many relevant posts are needed to entitle me to one cheap shot but you have failed to supply me with any figures. It's hardly fair to condemn my conduct when you have failed to familiarize me with the ground rules :)

By the way, what does Wifey say about all the girls calling you Mikey?

To All Concerned !!!! 13 Dec. 1997

I just called Fort Worth to very that scanner service manuals were available. The person read a memo to me that ALL service manuals were NOT to be sold to the public. I read the below statement to him.

That got his attention. He had to get his supervisor to verify what I said was TRUE.

WELL.... LOW AND BEHOLD, She said this statement below WAS TRUE !!!! So I am to call back Monday, when there computers are changed, and can order ALL the service manuals that I want and are still available according to the statement below.

I guess they do NOT want the word to get out. So as of the 15th of December, 1997, scanner service manuals WILL again be available !!!!!

Happy Holidays. icstars@flash.net

Hmmmmmmmm.

The recent sales ban on manuals *might* have that effect,
but I doubt it was intentional for that effect. There
really was a lot more going on under the table than you
might imagine. Many of us kept up with it.

The "effect", however, is certainly within the realm of
probability.....close to *certainty*, if you will.

If you miss out on one of these neat scanners (below) on eBay, and are still looking, I have the following:

RS 2026 Programmable 100 memory scanner (details and mod info E-mailed on request) Unmodified coverage 29-54, 108-174, 406-512, 806-823.9375,851-868.9375, 896.1125-956 mHz.
Nice condition w/mounting bracket & strap, and manual.
(Continuous 806-956 MHz coverage, and 30KHz search increments result from the one-snip mod. If that matters to anyone.) Asking $195.
Feel free to make a reasonable offer. Shipping is included, to CONUS.

In North America, the only things permitted in the AMPS spectrum are
things that can coexist with AMPS, that is D-AMPS, and AMPS. In theory
at least you can put CDMA in as well by deallocating 41 channel
blocks.

Also, on your previous point, I believe Ericsson is

I would be surprised. ITU has not allocated 1900Mhz for mobile phone
use in Europe, however 1800Mhz is allocated.

What sort of crap is this? I was unaware that it was illegal for a scanner hobbyist to modify a scanner to receive cellular frequencies, even though the act of intentionally MONITORING cellular COMMUNICATIONS may in ad of itself be illegal. Might Paul have cited some sort of law to support this "We've got all the fucked up answers" stance of the Shack?

More to the point... this is the THOUGHT POLICE! Paul didn't say "Do illegal modifications", but rather used the wording "Develop illegal modifications" which in my mind includes working it out on paper instead of actually attempting the mod on hardware.

>> * Modified scanners (regardless of frequency or date of

This seems reasonable... until you realize that you have no other option to repair other than through an authorized center for those scanners which do not have service manuals available to the public.

>> * To the extent that scanner parts are available and in stock,
>> scanner replacement parts will continue to be available regardless of
>> the scanner's frequency range or date of manufacture.

Of course, Tandy might have to gear up their production of spare parts due to hobbyists TRYING to fix their scanner blindly... but that won't matter... the hobbyist won't have any idea what part to order anyway... and going into the local shack, the droid will inform the hobbyist that Radio Shack at any time in the past, present or

future, ever sold parts for their equipment.

ObRadioShackDroidStory: Last month, I got a call from a long time customer of mine, asking if I knew where he could get cassette tape splicing equipment. I suggested Radio Shack. My customer responded that he had already called Radio Shack and they informed him that they didn't carry such stuff.

I placed my customer on hold, ran back and grabbed an old (96) RS catalog, and gave him the RS Catalog number for the items he needed. I told him that the info was from an old catalog, but it at least was an answer more in line with his question than which Radio Shack gave him.

My customer called us again last week, and I asked him about his slicing problem. He told me that he had called a different Radio Shack (I guess he was fed up with the first) and read them the part number. The Droid, while not knowing what it was for, did admit to having five of the items in stock... Problem solved... no thanks to the Shack's Logo Phrase... "Duh?"

Here's the bullshit reply I got after asking if a service manual was
available for a
PRO 2030:

Early in 1997, representatives from industry, including RadioShack,
met
informally with the FCC to discuss current problems in the scanning
hobby. Identified as a major problem was the ability of some scanner
hobbyists to develop illegal modifications that allow scanners to
receive cellular telephone transmissions. Among the possibilities
discussed for eliminating this problem were the total epoxying of all
circuit boards, which would render scanners both unmodifiable and
unserviceable, or the restriction of technical information regarding
scanner circuit design.

As a result of this meeting, Tandy limited the availability of scanner service manuals to Tandy Service Centers only.

While Tandy understands the desire of the do-it-yourself community to have easy access to service information, we feel the interests of the scanning hobby as a whole are best served by making it more difficult to
develop illegal modifications by restricting access to some service manuals containing schematics.ï¿½ Therefore, in response to industry concerns, Tandy is implementing the following policy in regards to the release of service information and the servicing of scanners.

Tandy (RadioShack and TechAmerica) will withhold schematics (service manuals) for all scanners that can receive 800 MHz or above which were submitted for FCC certification after April, 1997.ï¿½ As of December 12, 1997, this means that service manuals for the followingï¿½ RadioShack scanners will not be available: 20-417 (PRO-2048), 20-430 (PRO-2050), 20-512 (PRO-67), and 20-520 (PRO-90), along with all future service manuals within the stated criteria.

To the extent that service manuals exist and are in stock, schematics (service manuals) for scanners that can receive 800 MHz or above that were submitted for FCC certification before May, 1997 will continue to be available to customers and others.

To the extent that service manuals exist and are in stock, schematics (service manuals) for scanners that cannot receive 800 MHz or above will
continue to be available to customers and others.

Modified scanners (regardless of frequency or date of manufacture) will
not be serviced by Tandy. These scanners will be returned to the customer with a notice indicating that the unit appears to have been modified and if the scanner is returned to its original specifications,
Tandy will use reasonable efforts to repair it.

To the extent that scanner parts are available and in stock, scanner replacement parts will continue to be available regardless of the scanner's frequency range or date of manufacture.

Schematics and technical information is available in the Service Manual.
You should be able to obtain a service manual from Tandy National Parts.
The address and phone number for Tandy National Parts Warehouse is:

ï¿½ï¿½ï¿½ï¿½ National Parts
ï¿½ï¿½ï¿½ï¿½ 600 Tandy Technology Centerï¿½ï¿½ï¿½
ï¿½ï¿½ï¿½ï¿½ Fort Worth, Texasï¿½ 76102
ï¿½ï¿½ï¿½ï¿½ Phone: 800-843-7422
ï¿½ï¿½ï¿½ï¿½ï¿½ Select option 3 Catalog, Part and Accessory Order
ï¿½ï¿½ï¿½ï¿½ FAX use:ï¿½ 800-821-1959

The scanner can also be reset through the serial port, if desired. The command is AC, followed by a carriage return. The radio, of course, must be in the remote mode. Send the data at 9600 baud, 8 bits, no parity, 1 stop bit AKA 9600: 8,N,1

I believe the new Alinco DJ-X10 fits the bill. 1200 channels continuous in a non-volatile EEPROM chip. You might have a bit of trouble picking one up in the U.S. though, I heard it failed FCC approval.

If you want more info on the rig, there is a review of it in the September 1997 issue of Popular Communications.

Hope this helps,

ciao

Is there an inline S meter for scanners (wideband from atleast
25-1300Mhz)
if so where can it be found.

second question,

anyone have a list of police codes for upstate NY police (Albany area)
or for the NYS police.

thanks in advance,
Aaron

Thanks for you help on the reset. I'm somewhat surprised that Uniden doesn't mention how to reset the microprocessor, especially since units out of the box seem to be in random settings.

I concur with your observations about images on the 895. I am having especially bad TV video images in the 460-461 range. On 460.375 I have a full scale signal from somewhere. I can take the unit to the basement, and the signal is much weaker on 460.375, but it makes anything within +/- 50kcs pretty worthless.

I suppose that most people will buy the 895 for the trunking features, and on 800, the radio performs well. Too bad the standard UHF range is only so-so.

> and be sure I won't miss something sometime????
>
> I have heard nothin' on the freqs before but there is always a
> first time...Or is there???

You can delete them.

A "stakeout" would be an example of why they would "bypass" the repeater. They only need to talk to each other for a block or two, and don't want what they are doing re-broadcast all over the city.

For the most part, if they want to use the channel for "local" car-to-car, or "simplex" communications, they will usually use the "repeater/base" ("output") channel.

If they used the "mobile" ("input") channel, they would "plug-up" the repeater for the rest of the city.

If they use the "Base" channel, they can talk locally amongst themselves and still hear the main channel. The repeater can still operate as usual for the rest of the city, and "step" on them if needed. They also do not have to change the PL tones.

Think about the operation of the repeater, and it makes sense.

However, most agencies have specific frequencies designated for "simplex" communications.

They're a European brand.....not FCC certified for
sale in the USA, and so are contraband.

There is always something great about being the ONLY
one on your block to own something, especially if
you smuggled it or otherwise brought it in illegally.

Illicitness adds flavor to the item.

Well, at least I'm employed. When do you think you might give it a try. George, if you work real hard, get a paycheck, you might have a few bucks to buy a scanner. The thought boggles the mind, but....you then might be able to post something about the hobby for a change!

> I just got one of these, it is several years old but it seems to work
> ok, it is supposedly 25-1300 Mhz and has no restrictions.

That isn't quite true. From the factory, the PRO-2004 was
capable of 25-520 MHz; 760-825 MHz; 845-870 MHz; and 890-1300 MHz.
Removing a diode gave continuous coverage from 760-1300 MHz.
There is no "restoration" of the gap between 520-760 MHz.

> Is this a good scanner and what is it worth now (roughly)

The PRO-2004 was introduced in September, 1986 and fared until
roughly May, 1989, when it was replaced by the PRO-2005. It is
an excellent scanner, arguably the best scanner of all time. That
sloping front panel with the tactile keypad remains unique and
unreplicated by any other.

Since it is somewhere between 8-11 years old, its intrinsic
value can't be a whole lot, but the PRO-2004 still sells briskly
on the used market where prices fetch anywhere from $25 for basket-
cases to $200 or more, if in clean, working condition.

1351. Minitor I question

Newsgroup: rec.radio.scanner
Date: 1997-12-13 00:00:00 UTC
From: ckiser6616@aol.com
Message-ID: <19971213132901.IAA15616@ladder02.news.aol.com>
Source record: 177585

I have an old used Minitor I that is not on the freq. that I need it on. It was free I wasn't going to turn it down. How difficult is it to change it, or is it even possible. It is now at153.965 and we use 154.250. Any help would be greatly appreciated.

Thanks

Chad

I have an unblocked Optoelectronics Xplorer for sale. It is in Mint condition. I've captured the elusive freqs that I wanted at the local mall, so now I'm ready to pass it on to a new "explorer". 7 months old.

Comes with all original accessories- Xplorer, Zipper case, Telescoping Antenna, Computer Cable, Software, Manual plus a few extras: Stubby duck antenna for covert operations, Spectrum FCC Database CD and I'll pay shipping USPS COD Priority Mail with insurance.

I'm asking $800. Or best reasonable offer.

Tom

The "base" station of a cordless phone is the unit from which we hear both sides of a conversation on a scanner. If one is nearby the person using the cordless phone, he can hear the hand-held portion, but only one side of conversation with any volume intensity. Here, we can copy cordless phones over 20 miles away and on one occasion copied a conversation from a cordless phone base in California (hot skip, huh?) Cordless phone frequency info is available everywhere but if you are serious about learning them, and cannot find them otherwise, e-mail me and I will send them to you. Best wishes! Ed W4SOD

Whoops! "Reconditioned" means they were once sold, and have been checked
and brought up to like new condition.
These units were never sold, but were, instead, "upgraded". They can
certainly be sold as new.

During scanning, when stopped on a signal and a person's voice reaches a certain high volume it will tend to drop that signal and scan to the next. It is as if the power to drive the increase in audio from the person raising they're voice is sapped from the signal strength so it falls below the squelch threshold and moves on to the next signal. Has anybody else experienced this? Please help! Thank you.

(snip)

I wrote one that waits for a signal on a user defined frequency. Once it hears that freq, it reprograms bank 10 with related freqs, locks out all other banks, turns on the recorder, and continues so until either a user defined amount of time passes with no activity...or, until a user defined amount of time elapes regardless of the activity. Once either of the time constraints is met, it programs bank 10 back the way it was, turns off the recorder, and begins scanning like it was prior to the target signal being monitored.

Lots of uses for that one, if you ask me...

Andy

I have the following Radio, and electronic equipment for sale. Reasonable offers or trades for radio or high end computer EQ. will be considered. All gear working last time tested unless noted.

Thanks

Kenwood TS-820S - Digital Ham Transceiver 120-10 meters. Looks good and works well. 100W output. $400

Tempo-1- Tube type Ham Transceiver/with Power Supply 80-10 meters. Looks and works well. 100W output. $250

Siltronix 1011C- 10 meter and CB AM or SSB Transceiver. Looks and works well. 250-300W PEP output on SSB. $225.

Siltronix VFO Model 80. $75

National Two/Seventy Ham Receiver with 6 Meter band. All Tube with matching speaker $250.

Pearce Simpson, Guardian 23- All tube CB Transceiver/with mobil power cord and mounting bracket. Looks and works Good. $150

Traynor, Group Two B- Audio Amp Head. High/ Low mic. in puts. Master volume, volume, bass, treble and tone shaper controls. $150

Pro 62 - As new. Purchased 4-5 months ago. Still under warranty. Have original sales receipt box manual etc. It is triple conversion Hyperscan 200 channel scan covers from 30-960 MHz. $150+ shipping.

Sears- 10 channel Crystal Control Table top Scanner. $50

Regency- 10 channel Crystal Control Table top Scanner. Wood case $50

Realistic Pro30- Programable Hand Held 16 Channel scanner. 30-50,108-136, 138-174, 380-512 Mhz. $60

Craig- 6" Reel to Reel Stereo Tape Recorder. $50

AR Inc.- Stereo Amp, all solid state. $125

Channel Master- Tube Stereo Receiver (Model 6612) and matching amp (Model 6601) Looks good and plays on FM. AM not working. $150

Yashica Eletro 35- 35MM Camera with Telephoto 1:4 , Wide Angle 1:4 and Tele-wide finder lense. $100

Sam's CB Fotofacts. Have 100 + copies and many in series starting with #1. Make me an offer for the set. specific copy offers will also be considered. Let me

know what you need.

Robin,

What happens is that if an FM signal has excessive deviation (which
appears in the receiver as excessive loudness), as the signal swings
wider than the receiver's bandwidth, noise is generated which can
false a noise squelch into thinking the S/N ration has dropped below
the minimum threshold. This causes the squelch to release and the
radio to resume scanning.

This is a problem of the transmitter (and also quite illegal per FCC
rules - excessive deviation causes adjacent channel interference) and
there is not a hell of a lot one can do at the receiver to compensate
for it. The funny thing is that the better the receiver, the more
prone it is to this problem (because the better receivers has nice
tight IF filters and such to give high adjacent channel rejection).

1370. Re: Repeater

Newsgroup: rec.radio.scanner
Date: 1997-12-13 00:00:00 UTC
From: Tork <tork@cts.com>
Message-ID: <01bd07e1$5043d260$889ed8cc@davetork>
Source record: 177604

The mobile freq is mostly likely a "simplez" channel, meaning it is used for short, line of sight, communication. Or the channel is used to hit the repeater, the repeater (base) is located on a high point, a tall building, mountain etc. The repeater then broadcasts from the high point to all the other units. In this case unless your at a high point or very close to the "mobile" station you won't hear the mobile. Save the space in your scanner and just program the "repeater" or "base" channel in.

Hope this helps, and makes sense.

Happy Scanning,

David

John "call me Forrest" Mackey--KA0SSF wrote:

> Then why is it that trouble always seems to lurk when ever YOU
> are around?

You're just upset because there are people in the world, and the scanner groups, who won't put up with you idiotic and offensive behavior and they'll slap you upside the head and tell you. If you'll recall (stretch yourself, we know long term recall is a problem for you), you invaded the scanner groups after you were booted off the fido links for exactly the same offensive behavior you're demonstrating here. You like it here because there is no moderator to cause your ejection. But, you failed (or don't care) to realize that the people here WON'T put up with your antics anymore than the fido people did. If you think the people in the scanner groups are troublemakers because they won't kowtow to every word that slithers from your lips, then you have a long hard road to travel in this group. People are continually going to call you to task if you continue acting like a jerk. If you find that situation distressing, too bad. How it plays is up to you.

> I posted a suggestion that you (& a few others) STOP. Instead you
> reply with insults & swearing.

I've never sworn in a post yet. Unlike you, I don't need to. My vocabulary is sufficient that I can express myself without resorting to words of limited impact or clarity. If you'd finished high school, you might have been exposed to a larger body of literature and would have learned a wider viewpoint.

No kidding! You in any mood to post it? Easy enough to
do since Scripts are just text files. Maybe we can get
a Script Exchange going?

I haven't seen much interest on the whole, but maybe
because there hasn't been enough publicity.

/Bill

That is a strange phone you have. You say it has a cord, or wire as you
call it, and it also is "cordless phone", ie, with no wire. You should
call it a "Escher Phone"!

==========
Subject: Unauthorized WINRADIO Hack
From: DrQuack@intergate.bc.ca
Date: 1997/04/19
Message-ID: <DrQuack23733@intergate.bc.ca>
Newsgroups: rec.radio.scanner

Dear Hackers and Crackers!

This document is a purely UNAUTHORIZED WINRADIO SDK
(software developers kit) brought to you by an escapee
of the Legion Of Doom, or perhaps a liberated asylum
inmate. This is not manufacturer-provided info. They do not
supply this information even if you beg for it (believe me,
I tried). But there are other means of getting what you want...
What you do with this is strictly your business. Warning: don't
go to Rosetta Laboratories for support, clarification,
interpretation, or other help. If you do, they might go into
spasmic shock and could even call a lawyer in... :-)))

With the below information, you can get right to the heart of
matters - the original Windows user interface is no longer between
you and the WiNRADiO card. You can control it directly from your
own software: use your imagination. No guarantees, no claims, no
bullshit, no nothing is attached to this information.
==========

Directly Communicating with WiNRADiO

Port addresses
==========
The card occupies eight consecutive I/O addresses.
The base address may be one of:
180h, 188h, 190h, 198h, 1A0h, 1A8h, 1B0h, 1B8h

The eight ports are used as follows:
Offset Read Write
====== ========== ==========
0 Read MCU data Write MCU data
1 Read status Reset MCU (1)

2-7 reserved reserved

Note 1. Write 0 then 1 to BASE+1 to force a hardware reset
of the MCU. This will re-initialize the receiver card.

The status port (at BASE+1) is configured as follows:
Bit Name Function
======= ======== ================================
0 IBF High if Read-MCU port is full
1 OBF High if Write-MCU port is full
2 -XLD Inverse of PLL lock detect signal
from radio card
3-7 reserved Reserved

MCU commands
============
The MCU responds to the following commands:
* Some commands are followed by one or more data bytes,
noted in the WR# column. Some commands return one or
more bytes of data, noted in the RD# column.
* Before sending a byte, wait until bit 1 of the status
port is clear.
* To read a byte, wait until bit 0 of the status port is set.

Group Cmd Name Function WR# RD#
======= === ===== ================================== === ===
MCU 00 NOP No operation - -
fnctns 01 RESET Reset all outputs to startup values - -
00-1F 02 SETHARD On MCU reset, reset receiver card also - -
03 SETSOFT On MCU reset, do NOT reset receiver card - -
04 SOFT? Return 0/1 if hard/soft reset enabled - 1
05 CLRINIT Clear "initialized" flag
06 SETINIT Set "initialized" flag - -

6F SETPLLA Set PLL register A 3 -

Queries 80 MUTE? 0 if mute is on - 1
80-9F 83 ATTEN? 1 if attenuator is on - 1
85 BAND? Band# 1/2/3 - 1
86 MODE? 0=SSB, 1=AM, etc. - 1
88 MX? 1=mixer A, 2=mixer B, 3=both - 1
89 VOL? Return current volume setting 0-31 - 1
8C PLLC? Return current PLL register C - 1
8D PLLR? Return current PLL register R - 2
8E PLLA? Return current PLL register A - 3

Setting the Frequency
=====================
Three values have to be sent to the PLL,
to registers C, R and A.

The frequency range is divided into 5 ranges:
0.5-300, 300-513, 513-798, 798-1106, 1106-1300 MHz

To calculate the VCO frequency, add: 556.325, 249.125
58.075, -249.125, -556.325 MHz to the receiver
frequency according to the above ranges.

The PLL generates the VCO frequency according to the
following equation: fvco = 12.8 MHz * N / R

The value of R must range from 640 to 2560,
and N up to 262144.

The ratio of N/R must be calculated for the
desired VCO frequency.

Once the N and R values have been calculated,
the PLL can be programmed:

* PLL register C is always set to 0x2C
* PLL register R is set to: 0x4000 + R
* PLL register A is set to: 0x700000 + (N & 63) + ((N >> 6) << 8)

After the PLL has been programmed, the Band has to be set
(see commands 5A to 5C) and the Mixer has to be set
(see commands 66-68).

Setting the Volume
==================
After first applying power, the volume has to be reset
(allow about 1 second for the radio receiver to completely
power up before setting the volume, it may be a good idea
to mute the audio during the power up phase).

Send 31 to command 6A (write to volume register).
Send 0 to command 69, then send the actual volume
(also to command 69).
Once this has been done, the volume can be set by sending the
desired volume level to command 69.

Setting the BFO
===============
The BFO has to be within +/- 3000 Hz.
Setting the BFO requires calculating the 2 bytes
to be sent to command 0B.
First, if the receiver frequency is equal to or
above 513 MHz, negate the BFO offset.

Ct = pow2(5e5 / (3.14159 * (455.0 + bfo / 1000.0))) / 212.46 - 560.14
C = (47 * Ct) / (47 - Ct)
V = exp(((50 - C) / 41) * ln(10))

Value to send to BFO command 0B equals the Low byte and
High byte of the integer value of: V * 6553.5.

END OF FILE

==
DO NOT CONTACT THE MANUFACTURER ABOUT THIS INFORMATION !!

Bill has rendered a short sighted, cynical opinion on the "Yupi". Yes
it is not avalible in the U.S., but I think most people seek out
these units because of their excellent qualities, not because they are
"illicit"

Bill, can you direct all of us to a better handheld scanner than the
Yupi-7100 or the 9000 for 300 - 400 dollars blocked or not? If so I
would like to know about it.

A while ago somebody said that they would be releasing a beta version
of some new mdt software. I don't have the post anymore.....

Anybody know of any new mdt software????

Thanks!

If you live in IL.& own a scanner,you more than likely listen to
the IL.STATE POLICE!While listening you will hear them using
strange codes.About 200 different ones!A must have if you listen
to I.S.P.& WANT TO UNDERSTAND THESE CODES!!!If you would like
these codes,send:$6.95 (money ordesr only please)
to:BRENT CAMERON 10144 STATE RT 161 MASCOUTAH IL 62258-3206
Hundreds sold!

That is an outright lie. As you pointed out, your record speaks for
itself. And even when the "other guy" starts it, you immediately
escalate several notches.

The sad thing is that so many people believe your bluster.

Thanks, Rich for the information on the 9000 and the tremendous web site that you have developed. When ever I need information on a particular scanner I alway go to your site first for the bottom line.

I have owned many various models of scanners and have always found your reviews to be right on the mark. Now all I need to do is decide which company to buy from.

Yes even removed 2 of them and the third one still had the feedback.
It's the audio from the radio getting back into the synth.... (I need
to look that up) I'v seen it in the past in some commercial radios. The
Motorola S
TX had same problem in early version. They came out with a mod, a
rubber gasket that isolated the speaker from the mounting and lessened
the feedback via case vibration. That is what makes be think maybe the
plastic washe
rs would help. In my console I can not get my hand in to hold the
washers when mounting so I can try them to see. HOWEVER I did try
external speaker and that corrected the problem. Also tried just one
radio sitting on sea
t and that way the feedback only showed up on a few channels that use
hi devation and with me turning radio volume all the way up.

>Many thanks.
An outdoor antenna in your attic will be better than a whip. I have
used the old RS discone, a 1/4 dipole, and the RS mag mount in the
past. I currently have a Scantenna in my attic connected to a TV amp.
It would perform better outside, but they are MUCH better than a
rubber duck or a 3'-4' whip.
Fred

1404. RS 2026 $195.

I like to listen to the local (Southern California) National Forests... Angeles NF, Los Padres NF, Cleveland NF and San Bernardino NF. The US Forest Service frequencies are very active when there is a major fire or a rescue being conducted.

Also, I like to monitor the paramedic frequencies (463/468 MHz) and aeromedical helicopters (such as Mercy Air on 131.675 MHz).

Howz bout, monitor car-car input channel and switch to repeater
channel when a signal breaks squelch? (great for keeping tabs on Your
neighborhood instead of the whole city. Saturday nights can be
overwhelming)

Or mebbe searching a band of 800 mhz frequencies and switching up 45
MHZ when you get a hit.

Or mebbe Starting a tape recorder when one of 5 preferred channels in
a 400 channel radio is active, ignoring the other 395 channels.

Or mebbe starting a tape recorder when specified channels become
active between the hours of (your preference here)

Or mebbe Switching to a previously locked out bank when a Specific
tone is received on a Specific channel, then activating tape recording
on any or all channels in the bank and switching back to the original
bank when activity ceases or at a preset time.

Or mebbe just opening and closing squelch on a specified channel
(Causes a log date,time signal strength entry to be generated)
Switching to a different antenna and repeating the previous step. 24
hours a day for a week/month whatever.

Or mebbe starting a script that makes a complete listing of each channel contents.

Limits are you needs/desires/imagination, and a small ability to program in basic.

Of course the limitations of hardware dictate that these abilities are exclusively the domain of the RS PRO 2004/5/6 scanners ONLY.

Good Signals... LCM

>
> >Thanks for the reply Emilio, but I'm just looking for the frequencies.
>

You're certainly welcome "Robo". It is such a pleasure to help point an
"up-and-coming" in the right direction.
Those frequencies you seek - They seem to elude you. You are not alone.
In fact the designers of cordless telephones had in mind a simple
strategy: Make the phones have the ability to transmit conversations in
such a way that the handset need not be connected to the base by a wire.
It was through this vision, that technologists began to develop the
cordless phones. To accomplish this, they devised an ingenious method of
transmitting this information. It is through radio signals that this is
accomplished. Radio signals - as old as the universe yet as new as today
for those with the eyes to see new ways to put them to use.
These signals are sent out on certain "frequencies", each distinct from the
other. They carry the voices you hear on your cordless phones.
Now, to listen to cordless phones, you need to know the frequency of each
of these transmissions. If you don't know them, then you need to set out
to find them. Don't lose heart - they are out there. Don't be afraid to
ask questions if you need help, or you want information. That's what this
newsgroup is for. So I look forward to hearing about your progress.
-Emilio

P.S. Many of these you can pick up on your scanner!

You're certainly =
welcome "Robo". It is such a pleasure to help point an =
"up-and-coming" in the right direction.
Those frequencies =
you seek - They seem to elude you. You are not alone. In =
fact the designers of cordless telephones had in mind a simple =
strategy: Make the phones have the ability to transmit =
conversations in such a way that the handset need not be connected to =
the base by a wire. It was through this vision, that technologists =
began to develop the cordless phones. To accomplish this, they =
devised an ingenious method of transmitting this information. It =
is through radio signals that this is accomplished. Radio signals =
- as old as the universe yet as new as today for those with the eyes to =
see new ways to put them to use.
These signals are sent out on =
certain "frequencies", each distinct from the other. =
They carry the voices you hear on your cordless phones. =

Now, to listen to cordless phones, you need to know the =
frequency of each of these transmissions. If you don't know them, =
then you need to set out to find them. Don't lose heart - they are =
out there. Don't be afraid to ask questions if you need help, or =
you want information. That's what this newsgroup is for. So =
I look forward to hearing about your progress.

Forget Uniden, go check out G&G's site! A scanner repair shop who has been in business for longer than Uniden has owned Bearcat is one who is capable of handling your 200XLT. You'll be impressed!

Too damn bad! The AD clearly states that the coax is included. If the droid won't give you the coax, ask to speak to the DM (Droid Manager) and mutter a few choice sentences about "false advertising", "legal action" and "Better Business Bureau." I guarantee you'll get your coax thrown in the deal.

I have a question(And who doesn't in this place?)...

I have the Freq's for my local PD all on one bank of
my scanner memory (Pro-51).
For every "Channel" there are two freq's,
a "BASE/Repeater" and a "Mobile"... Only the "Repeater" freq
ever has any activity for any one channel.

What I'm askin' is can I delete the mobile freq for each channel
and be sure I won't miss something sometime????

I have heard nothin' on the freqs before but there is always a
first time...Or is there???

>If you mean that the 3000xlt and the 9000xlt is top of the line, you're way off. Try an alinco, aor, or yupi.<

I meant, of course, top of the line for Uniden. I agree that there are better radios on the market, but generally, whatever brand you look at, it's the top of the line for that brand that covers the 225-400 military air band.

>Guys can still have a scanner with the cellular unblocked and still not violate federal law.<

You are absolutely correct. Possession of a cellular capable scanner is not illegal. However, making coverage of cellular frequencies a condition of purchase certainly implies the user intends to use it to monitor those conversations, which is, of course, a violation of federal law, as well as the laws of many states.

> Thanks for your quick and lucid reply.
> I get the idea......sounds very usefull.

It is. There's just no easy way to convey the broader scope of the power of the CE-232 and the Script feature. But in a word, the Script lets you write a scenario under which the scanner is to perform and what it is to do *IF* certain conditions are encountered; *ELSE* do something different under other conditions. *AND* and *OR* logic can also be applied.

Other features of the CE-232 allow signal inputs from the outside world such as for an S-Meter. So one useful application would be for a search of some exotic band segment where you're interested in distant signals; not strong local ones. In this scenario, a few lines of Script can tell the scanner to resume scanning IF the S-Meter signal is stronger than a certain level.

And if it is equal to or under a certain level, then not only stop for as long as the signal is present, but also AutoLog the details to a file *except* if the duration of the stop is less than so many seconds, then do something, else. Also, if a certain signal passes these and other conditions, then the Script can also add some delay to ensure retrieval of any 2-way signals. The scanner is only good for 2-sec of delay, but the Script can add any desired additional delay, too.

Even CTCSS tones can be inputted to the CE-232 for decision-making in terms of processing and running a scenario.

It goes pretty deep, really. Most any logical process that you would employ in operating a scanner can be mechanized and automated via the Script and then set to run completely unattended.

That's Petey Joe Boe of Portland, Oregon. He's a music
teacher on court-ordered Prozac and Depo-Provera. He
can't retain his presence of mind for any length of time.
He fancies himself as Gunga Din, reincarnated.

Boe runs a couple of digits shy of a full Zip Code,
and a sandwich or two shy of a picnic.

Hi Bill,
If you are not going to use the TrunkTracking feature
then your money is probably best spent elsewhere. It does
have a few nice features...300 channels, 50 search-skips,
service search, good interference rejection...but for
most people this is not worth $300. Even if you mail order,
you're probably talking $250, which is still pushing it.

That poses a problem. What if you're talking on your cordless phone and somebody listens in on their scanner? Or their toy walkie-talkie?

I did develop a mod for my cordless phone. I opened up both the base unit and handset. Clipped out the radio part from each. Connected the clipped connections via a wire. Now I have the best of both worlds: a cordless phone, but with the security of a wired connection from the handset to the base.

Understandable.

However, if you have the printed instructions, why not
have someone scan them for you? That's about the only
way the instruction sets could ever be available in
ASCII text format anyway.

HACKING WINRADIO'S MEMORY FILES
==========

The broad spectrum (500 kHz - 1300 MHz) WiNRADiO receiver has the ability to scan 1000 channels or frequencies at a time. You can have any number of memory files so long as there are 1000 or fewer entries in each.

Until now, the only way to get a WiNRADiO (*.WRM) memory file filled with frequencies was by hand typing them via the user interface.

No more! The process can now be automated quite easily, such that PerCon CD data, ScannerBase CD data and even your own databases can be used to *almost* talk direct to WiNRADiO. In a word, a "memory.wrm" can be created on the fly from other existing data resources. Gone are the days of hand typing a zillion records. Here's how it's done.

First, an astute hacker who wishes to remain anonymous has generously dedicated his time and skill to analyzing the WiNRADiO proprietary data file structures and found out how to recreate them by means of a PERL script to read conventional data in delimited ASCII or *.DBF formats, and convert that data directly to a WiNRADiO *.WRM memory file, all ready and set to go!

You need only a PERL Interpreter (PERL.EXE) and the freeware PERL script called: WRITEWRM.PL (not supplied here) and the below information. I am in possession of the WRITEWRM.PL script and will be happy to share it with bona-fide inquirers by e-mail. I will also be glad to direct you to a source for a PERL interpreter if you don't already have one.

Note: this process is undergoing constant revision, so it is to be considered a beta test and not quite ready for public consumption. Communicate directly with me for more details.

-Bill Cheek

##
######## WINRADIO FILE CONVERSION UTILITIES ########
######## INSTRUCTIONS & OVERVIEW #######

##

MEMORY (.WRM) FILE CONVERSIONS

To convert a winradio .wrm file into a pipe delimited flat
ascii file, use the following command:

perl readwrm.pl infile.wrm > freqfile.txt

This will produce an output file like the following, consisting
of the memory location, the frequency in MHz, the groups, the
"set mode" indicator (0/1), the mode (AM,FM-N,FM-W,SSB), the call
sign and the comment fields.

5|1.100|{3}|1|AM||Cincinnatti, OH
6|1.110|{3}|1|AM||North Carolina
7|1.210|{3}|1|AM||Philadelphia, PA
8|1.140|{3}|1|AM||Richmond, VA
9|106.700|{}|1|FM-W||WJFK
300|5.070|{}|1|AM||WWCR
301|3.215|{}|1|AM||WWCR
302|3.210|{}|1|AM||WWCR
303|5.085|{}|1|AM||WGTG
304|9.400|{}|1|AM||WGTG
305|7.355|{}|1|AM||
306|12.160|{}|1|AM||WWCR
307|2.390|{}|1|AM||WWCR

(Try "perl readwrm.pl -help" for more on the readwrm utility.)

To convert such a flat ascii text file back into its .wrm
equivalent, try the following:

perl writewrm.pl -o outfile.wrm freqfile.txt

This command will produce a new outfile.wrm winradio memory file
from the input flat file, freqfile.txt .

PerCon .dbf format to .wrm file conversion: -percon

It is also possible to convert .dbf frequency files written by
the PerCon Spectrum program (tested with 1996 PerCon CD).
Given a Percon output .dbf file (freqfile.dbf, say), the
command:

perl writewrm.pl -percon -o outfile.wrm freqfile.dbf

would create a new output.wrm file.

Generalized .dbf formats to .wrm file conversion: -dbf

It is also possible to convert .dbf files produced by other
programs, provided that certain fields appear first in the dbf
records. These fields are: memoryloc,frequency,groups,setmode,
mode,call, and comment. (I.e., the same fields that winradio

uses in .wrm files.) Those fields should appear first in
the dbf record.

perl writewrm.pl -dbf -o outfile.wrm freqfile.dbf

(Try "perl writewrm.pl -help" for more on the writewrm utility.)

Appending to Existing .wrm Files

It is also possible to append new entries to existing .wrm files;
the -a option (when used in combination with -o or -O) will cause
the output .wrm file not to be erased, but entries will be added
to the end of the output .wrm file.

Text formats to .wrm file conversion: -pat

It is also possible to convert text files that have frequency
lists (line-oriented lists). Text files containing lines like:

853.9625 Mudville Municipal Water District, 1
854.9625 Mudville Municipal Water District, 2
855.9625 Mudville Municipal Water District, 3
808.9625-Mudville portables
460.1300,No Joy In Mudville Wrecker Service
A1 120.1,118.6 ... Mudville Muncipal Airport

are parsed, and frequency/comment information is used to form
.wrm entries. Say the above text was in a file named
freqtext.txt, the following command would extract the
frequencies, and place them in the output .wrm file, mem1.wrm

perl writewrm.pl -pat -o mem1.wrm freqtext.txt

The -pat option uses the frequency to make an educated guess
as to an appropriate mode.

Controlling -pat Memory Location Numbering

The "-l n" option may be used with the -pat option to force the
.wrm memory location numbering to begin at a given number (between
0 and 999 - the .wrm limitation). The default is to start numbering
at 900. This command would begin numbering at 100:

perl writewrm.pl -pat -l 100 -o mem1.wrm freqtext.txt

Controlling -pat Groups

The -g "grouplist" option will allow the setting of a group or groups
for all frequencies in the input file. For example, the following
command would set the groups to 4, 10 and 6 for all frequencies
in the freqtext.txt input file. By default, the group 16 is used
unless overridden using the -g n option.

perl writewrm.pl -pat -g "4 10 6" -o mem1.wrm freqtext.txt

The -g mode variant of this will assign groups according to mode:

```
perl writewrm.pl -pat -g mode -o mem1.wrm freqtext.txt

The group assignment with the -g mode option will be as follows:

group 1 - SSB only
group 2 - AM only
group 3 - FMN only
group 4 - FMW only
group 5 - everything: all modes
group 6 - AM,FMN
group 7 - AM,FMN,SSB

Searching For Patterns

The -grep "pattern" command will cause the converter to reject
input lines that do not match "pattern". The quotes are optional,
and only necessary if the pattern contains spaces or other
DOS special characters. The pattern is case insensitive. For
example, to restrict the above example to search only for entries
containing the word "water" (case insensitive), the following
might be used:

perl writewrm.pl -pat -grep "water" -o mem1.wrm freqtext.txt

The -grep option may be used with other input sources besides
-pat; only the callsign and comment fields are searched (for
Percon the call, db_name, address, and city fields).

Controlling Call Sign

A pattern-matching scheme looks for call signs in the comment
field when doing a -pat conversion.

If no call sign is found, then there are several possibilities.
If there's something that looks like a channel number ("Ch.1",
"channel 4b.", "F7a", etc.) then that will be used. If the
-call C option is used, then "C" will serve as a default "call
sign". If a likely channel number was located and a -call option
was supplied, then the call followed by the channel number is used.

perl writewrm.pl -pat -call "CityWater" -o mem1.wrm freqtext.txt

A call sign may be up to 9 characters, and must not contain spaces.

Batch File Ideas

It is possible to combine the above options in somewhat complex
batch files. For example, the following commands, placed in a
batch (.bat) file, would create a mem1.wrm that had "water"
entries starting at location 100, "airport" entries at 200, and
"gas" entries at 300. The "water" entries would have a group of
1 and 2, the "gas" entries group 4, and the airport entries
all with group set to 1.

>- perl writewrm.pl -pat -g "1 2" -grep "water" -l 100 -O mem1.wrm freqtext.txt
>- perl writewrm.pl -pat -g 1 -grep "airport" -l 200 -a -O mem1.wrm freqtext.txt
```

```
>- perl writewrm.pl -pat -g 4 -grep "gas" -l 300 -a -O mem1.wrm freqtext.txt

> than buying new from Radio Shack. ($450 vs. $250)

The PRO-26 has been discontinued for awhile now. Grove probably was
lucky enough to get some at a big discount.

RS has the PRO-64 for $199 on sale and it's 400 channel, so $250 for the
PRO-26 200 channel wideband handheld is probably within reason...

Grove will definitely treat you right. They ship 2 day UPS at basic
shipping rates and you will have it in 2 days as they say!

I am looking forward to buy a new scanner to replace my Realistic. I am considering:

Icom IC-R10
Alinco DJ-X10
Yupiteru MVT-9000
AOR AR8000

There are a lot of reviews out there but I need some "helpful" recommendations on which one I should buy. I want a scanner that has quality construction,good price/performance ratio and good coverage.

I know this is a tough choice, any suggestions will be greatly appreciated. If you could, please summarize the pros and cons of the each of them.

Thanks! Happy scanning!

Sincerely,
Ian Thow

Barry,
Those are some unusual freqs you listed. Hope there's no
broadcaster in your area using TV channel 2! All "FRS" units operate in
the 462/467 MHz range. RS has some HTs that still operate in the 49 MHz
range but those are not FRS units.

Exactly. That's why there won't be a round two. I refuse to take advantage of someone who is not intellectually capable of defending themselves. Constantly trying to change the subject and using offensive language are the two biggest signs you're dealing with a child. And as we all know it is not proper for an adult to take advantage of a child. I never have and I don't intend to start with Mr. Bill.

This is not a company policy of Radio Shack. This is dependent on the individuals behind the counter. Don't try and pretend that Radio Shack is so benevolent. If the guys working the counter don't give a crap, don't expect to be getting some great frequency list as you claim.

> One, smuggling is against the law. It IS a crime. It is
> punishable by fine and/or jail, and under certain
> conditions, death.

Death? That's not smuggling...it's called espionage. Please get your terms straight..."Man smuggles illegal radio into the country...sentenced to death...details at 11". You just love to change the topic to avoid the issue don't you?

Well Mr. World Traveller, last time I checked, US Customs allows personal property to be brought back into the country. Like when I visit Japan, buy a radio so that it becomes my personal property and bring it home along with various other trinkets. US Customs has seen my "illegal" radios and let them through every time. So what law exactly is it that I'm breaking? Try "none".

> Two, modifications are not. What guy hasn't crawled under
> the hood of his car and did some tweaking and rearranging,
> adding some bells and whistles? What home owner doesn't
> modify his premises from the builder's original spec? What
> computer doesn't get opened up and things added to it from
> time to time? Modifying things is a legitimate and
> time-honored aspect of American life.

Yes. I'm sure the FCC and the CTIA would see it that way also if they were to be notified that there were a series of books that informed people how to hack radios to do all kinds of "nice" things. Especially in today's radio paranoid society. I'm most sure your mature arguments would sway them over immediately.

> There is a world of difference betwixt SMUGGLING and
> modifying, Mister Wells. It's real simple, Bubba: to get a
> Yupi into this country, it has to be SMUGGLED.....

Wrong again.

> Ha ha ha ha ha ha ha ha ha.....now I know you're drunk or
> stoked up on some bad wacky backy. You ever see my lab?

That's right. Try to change the topic again. We want to hear
all about your "lab" and the hulks of 10 year old radios
laying around.

Face it, you haven't even used a Yupiteru, or an AOR or an
Alinco or a Standard and you still stand on your pulpit
and claim how they are so inferior.

> So? So we hack and modify and make it so. Big deal.

It is a big deal. Try and picture this...not everyone
wants to hack around with a radio and make it do things
if you can buy one that way out of the box. You get
what you pay for. It is not our problem if some of us
can afford the more expensive models and would rather
USE our radios then spend time HACKING them.

But you'll never understand this because everyone has
to think and act just like you. Otherwise they are some
form of evil that you have to try and suppress by
calling names and other childish behavior.

> Now I'm not sure now whether you're drunk, stoned, or just
> plain stupid. ALL our damn radios are imported, you
> ignoramus! I didn't say a thing about importing. How could
> you have read that I did....unless you're stupid? Or drunk?
> Or stoned? Or got bit on the arse by your own dog?

I'm sorry that you could not infer from context Bill.
Not all radios are imported for one. Have you heard of
RELM? Have you heard of the MS200? Made here in the US.
I'm sure that raises your patriotic flag to no end.

Secondly, most people understand the fact that "importing"
means to order the radio from overseas as oppossed to
going to your local radio dealer here in the US. I'm
sorry that I confused you so with such a complex topic.

> I talked of SMUGGLING, you dumbass! C'mon, get your shit
> together, man. At least talk some sense.

Ah. As we can see, you talk nothing but sense. How foolish
of us not to realize your use of hypocrisy, name-calling,
disortion and exaggeration, as well as trying to change
topics when you can't defend yourself, are all forms of
a man who is talking sense.

> I told you two can play!

Everything has to be a pissing contest. It's
either the Cheek way or the highway. And you probably
wonder why so many people find you irritating and
irrational.

> c'mon, c'mon, c'mon, Mister Wells. Let's see what you're
> made out of. Let's see if you can outdo Mongrel Mackey.

Neither of you are really worth the electrons it took to
send this message. And as you've just admitted, your waste
of bandwidth has been seen before between you and Mackey.

What you may have once been to this hobby has been put to
shame and far outshadowed by all your childish antics.

___ DA 97-334 February 13, 1997 MANUFACTURING ILLEGAL SCANNERS
INCLUDES SCANNER MODIFICATION

It has come to our attention that entities are offering to modify
scanning receivers (scanners) in order to receive frequencies allocated
to the Domestic Public Cellular Radio Telecommunications Service. Such
modifications are not permitted under federal law and the Commission's
rules. ========== Paul
Opitz

Here's a couple things you could try:
Brian Verine's excellent website: http://www.orst.edu/~varineb
Also to get on the Northwest scanner list send email to:
majordomo@teleport.com
with nothing in the subject and
subscribe nwscan-l in the body of the message.
But you probably know all this already, right?

Maybe someday we could get together in the Portland area with our
scanners. Council Crest?

Best regards - LH

Hi, I am looking to sell my two scanners

the first is a Pro-51. This scanner will offer you a wide variety of pleasureable listening. It is in very good condition. Covers the 800mhz, all police, fire and ems bands and low bands

the second is a Pro-2040. This scanner will offer you a wide variety of listening also. this scanner containes the same things the other one has.

both scanners are not damaged, i am looking to sell for $200 for both scanners I am willing to sell them seperate if necessary

my email is cmancman2@aol.com

Is there any scanner around, modified or not, handheld or mobile, with
1200 channels (or more) IN ONE CHUNK (i.e. that can scan all of them
in one scoop)?
Better yet, a FAST scanner (around 100 channels/sec, such as Uniden
scanners or PRO-2004/5/6 with Opto boards)?

Thanks.
Tinkerman

I bought a couple of these guys a few months ago at a PAMIDA discount store. Paid $69 each. Its a nice second scanner, goes mobile or base. Searches and scans very fast. Gets 800mhz , blocked. Another nice feature is the service search.
There are a some downsides to it though. The searches are preprogramed, I think in 12 or 13 banks. These banks are quite large, not very handy. There is no numerical keyboard to enter freqs, you need to go through the search feature, find the freq, then enter it, kind of slow. The amount of freqs you can program is decieving. There are 50, but that is 20 in a private bank, 20 added to the police bank and 10 added to the fire/emg bank. Probably not a bad radio $50.

I bought the first PRO-2004 that my local RS store had in stock, and
it's been running continuously, day and night, since then. It's never
given me a minute's trouble. Oh, the backlight is pretty much dead,
and the Volume knob could benefit from a bit of cleaner, but other
than that, it still runs like new.

A good one would surely be worth $200, especially if the backlight
were still in fairly good condition. I really regret not getting mine
replaced back when they were still available.

The really sad thing about this is that it's true. It's the exact
same mentality that keeps the spammers in business. P.T. Barnum said
it best, and it keeps the con men, scam artists, televangelists, and
socially challenged flamers from going bankrupt as they deserve.

When it comes to advertising, there's no such thing as bad publicity.
Any guesses as to how many WinRadios have been sold as a result of the
recent unscrupulous tactics of a certain "representative" of WinRadio?

To All Concerned !!!! 13 Dec. 1997

I just called Fort Worth to very that scanner service manuals were available. The person read a memo to me that ALL service manuals were NOT to be sold to the public. I read the below statement to him.

That got his attention. He had to get his supervisor to verify what I said was TRUE.

WELL.... LOW AND BEHOLD, She said this statement below WAS TRUE !!!! So I am to call back Monday, when there computers are changed, and can order ALL the service manuals that I want and are still available according to the statement below.

I guess they do NOT want the word to get out. So as of the 15th of December, 1997, scanner service manuals WILL again be available !!!!!

Happy Holidays. icstars@flash.net

Well, it looks like I got the cheap RG-8 cable instead of the good stuff. This one is labeled Tandy wire & cable E111378A Type RG8/U Mini Foam 16 AWG CL2. OD is about 1/4". It had 7 strands (give or take 1 or 2) for the center cunductor. Darn. Oh well, still better than the rubber duck antenna. I'll get some better stuff eventually, like when it gets warm. For now, this will do just fine. At least it was free!!

Or am I wrong and is this stuff good??????

Unless, of course, you're listening to Los Angeles County Sheriff's Department... which uses a Half-Duplex system. You'd have to have both frequencies programmed in if you want to hear the mobiles. Of course, you still have to hear that annoying "busy tone" on the base channel while some other mobile unit is transmitting.

These tones allow for voice pagers aka "Minitors", fire sirens,
disaster sirens, etc. to be activated.

Mainly used by FD & EMS to alert volunteers for crews needed for
emergencies. Use varies by agency.

There are several different types & formats, you can get some more
info at my home page:
http://www.geocities.com/CapeCanaveral/Lab/1060/

Under the Tones Section.

1472. HELP: Frequencies for Alpharetta/Roswell Georgia are requested

Newsgroup: rec.radio.scanner
Date: 1997-12-14 00:00:00 UTC
From: lotus1981@aol.com
Message-ID: <19971214045601.XAA18255@ladder01.news.aol.com>
Source record: 177447

Please help me. I will be taking a trip to Alpharetta Georgia soon and would like to take my scanner. I would like the frequencies for the local fire and police. I know that the local fire is called North Fulton County Fire Department. Any help in finding these frequencies would be a great help.

Thanks

Lotus

Then filter them out, and you won't have to even see them, much less
read them. Also, don't post to them, as you just did.

Oh, wait... (clickety, clickety...)

I see you're on WebTV. Never mind.

Hi:

I am looking for the software to set up the binary
data on the epromof the Tait 500,520,550 radios
,these radios came in several versions the two
channel type with a diode matrix board, a 40
channel type with a rotary selector switch and a
99 channel type with an up and down pushbutton and
seven segment display,
Can anyone help,,,,I would be thankfull

> Better yet, a FAST scanner (around 100 channels/sec, such as Uniden
> scanners or PRO-2004/5/6 with Opto boards)?

Ummmmm....<thinking real hard>....I don't think so.
However, there are a couple of methods by which my Extended
Memories can be scanned in one fell swoop. I'm talking
about external add-on devices to make them do that, but
yes.... My CE-232 Interface can easily make that happen, as
can Mark Persson's LinkAll board. Takes your pick.

It might be possible to build an AND circuit that produces
an output when ch-400 is reached; and use that output to
boink a counter, the output of which could increment the
memory Blocks. I haven't looked too closely into that one
but it might be worth a look for someone who has the time.

> Better yet, a FAST scanner (around 100 channels/sec, such as Uniden
> scanners or PRO-2004/5/6 with Opto boards)?

Well, the PRO-2005/6 with Opto boards can go lickety split,
but I don't know if they can do memory control.

Yes I am certain that Radio Shack and Uniden sell their wares for the betterment of the radio monitoring hobby as well as all of our communities. They could care less about stock-holders and dividends.

> Ownership, possession, and whooping up the illicit Yupi
> radios only serves to irritate our Congress Critters and the

And what good does it do for our hobby to make modifications to radios so that they can decode pagers, receive SCA signals and other illegal activities? Must be nice to be such an angel and point the finger at everyone else...selective blindness to the law is great...especially when you can write books about it and newsletters to line your own pockets with money.

> Another one, if I may......is the monetary support (read

> around and add anything to the USA market and hobby.

Well then I will counter this age-old proverb with it's age-old response...if companies here made such great radios we would have no need to look abroad.

Yupiteru and the rest could care less about the puny amount of money they make from us Americans. Our numbers are diddly compared to what they sell in the Far East and Europe.

Oh, but I forgot...they are the Great Evil that must be eradicated from the planet or they will doom us all won't they? All the ills of the radio monitoring hobby can be placed on their shoulders.

> No, sir.....my offering was NOT at all "short-sighted". To

Saying quite a lot from someone who has probably never even
used a Yupiteru. Or an AOR. Or an Alinco. Or a Standard.
Perhaps if you had you'd realize just how ridiculous your
statement above is.

> Another is the PRO-43, gone from the shelves now. Another
> may be the Uniden BC-3000....or the older BC-2500. Any of
> these will outdo the Yupi's in receiver characteristics.

More blathering...

> Do they have cellular? No. But then analog cellular is
> almost a thing of the past anyway.

Who cares about cellular? Uniden and Radio Shack models
don't have alpha-tagging. Don't have S-meters. Don't have
bandscopes. Don't have adjustable power savers. Don't have
memory management features to copy/delete/move entire banks
and channels. And on, and on, and on.

Of course Bill knows that the ONLY reason people get these
radios is to listen to cellular. God forbid we might actually
want a radio that has features today that no Radio Shack or
Uniden will have for another ten years.

> If you are gratified by smuggling, then more power to you.
> I do not pretend to suggest what is right or wrong for YOU.
> But let's do be TRUTHFUL and tell it like it is. Buying
> Yupiteru radios is not good for the scanner community as a
> whole; nor for our country, even though it may be good for
> YOU.

I would say that compared to the few hundred of "illegal"
radios that get imported compared to the thousands of
Unidens and Radio Shack models that get sold, I doubt either
Uniden or Radio Shack will be in trouble any time soon.

What I do see pissing people off is the great Phantom
Service Manual debate bewteen Uniden and Radio Shack each

pointing the finger at each other or blaming the FCC for making them do it.

The only person I see pissed off about importing radios is you. But since it is your cause, it must be proper and it must be just for everyone else to side with you.

> I do not believe my prior post was shortsighted at all,
> Mister Blade. But I do believe yours was shorter than your
> whatchamacallit, if you catch my drift.

Yes...truly the words of someone we should all listen to. When you can't possibly win based on your lack of knowledge and childish biases, it always helps to resort to name calling and trying to insult the other guy's manhood. A true professional and gentleman if ever I have seen one.

Rich Wells <wellsr@ibm.net> unloaded his britches thusly:

> Yes I am certain that Radio Shack and Uniden sell their wares
> for the betterment of the radio monitoring hobby as well as
> all of our communities. They could care less about stock-
> holders and dividends.

Did you intend for that to be an asinine statement? Or was
it an accident. And I'm not talking about your facetious
reference to stockholders and dividends. I have no problem
with a *little* satire. It's that first sentence that
screams of imbeclic idiocy........

One, most every Radio Shack store has under the counter,
a freq list and a list of local clubs or organizations to
hand out to the newbie scannist. Granted, Radio Shack can't
expressly do much more than that....but multiplied by 8000
stores, that little bit ain't too shabby. Add to that the
dissemination of POLICE CALL, and I'd venture to submit that
this facet alone amounts to a darned decent service.

Two....despite any personal feelings I may have, Uniden does
their contribution, too. There's the Betty Bearcat book and
that Bearcat Club. I would guess that those two entities are
first contacts for many entering scannists.

<shrug> (Beats the shit out of what Yupi does.)

> > Ownership, possession, and whooping up the illicit Yupi

> with money.

Oooooohhhhh, getting nasty and *personal* now, are we?
Please don't forget that two can play the nasty game. You
don't get to shoot first and last... But I will defer for
the moment to address your next goofy inference.

One, smuggling is against the law. It IS a crime. It is punishable by fine and/or jail, and under certain conditions, death.

Two, modifications are not. What guy hasn't crawled under the hood of his car and did some tweaking and rearranging, adding some bells and whistles? What home owner doesn't modify his premises from the builder's original spec? What computer doesn't get opened up and things added to it from time to time? Modifying things is a legitimate and time-honored aspect of American life.

Geezus H. Kriste, Wells, whatsamatterwithyou, are you nuts?

As far as the illegal stuff goes....it STILL isn't illegal to modify scanners for the most part. It's only illegal to LISTEN to cellular, SCA, etc....and pagers hasn't been determined yet, I don't believe.

In any event, I wrote THE BOOK(s) on modifying BEFORE any legal ramifications came up. 1989-94. Even still, it's not illegal to write about any and it's not illegal to perform most.

There is a world of difference betwixt SMUGGLING and modifying, Mister Wells. It's real simple, Bubba: to get a Yupi into this country, it has to be SMUGGLED.....

> > Another one, if I may......is the monetary support (read
> > VOTE!) for a company and a product that does not care to

> we would have no need to look abroad.

The only thing you have to look abroad for is "coverage", and read "cellular", pal. Otherwise, those Europie contrabands don't measure up to our best in terms of vital receiver statistics. Just cellular, pal. That's all you get for your money.....and risk.

> Yupiteru and the rest could care less about the puny amount

Whatthehellsthematterwithyou, you drunk? Or just nuts?
Now you're spouting asinine *bullshit*, pal. You're going a
trifle overboard, aren't you?

Geezus, I must have goosed you real good. Pity that I
didn't know about it when I did. It would have been more
fun..... I always like a man to know for sure it was me
who hosed 'im. And I like to know when I do it.

> > No, sir.....my offering was NOT at all "short-sighted". To

How is this germane to the topic? But to give you a
straight answer, see if you can read this:

I don't see Mackey's messages, and I certainly don't respond
to them. Others? <shrug> There are others to whom I
never respond, as well. But there are others to whom I do
respond until they start acting like assholes, at which time
they go on my Shit List right along with the Mongrel Mackey.
He's Number One on my List, but he has good company.

So why this juvenile accusation, Mister Wells? "Mackey and
others", my ass. I don't reply to Mackey and YOU are one of
those "others", lad.

<giggling>

> > THAT, sir, quite depends on what it takes for you to call it

Ha ha ha ha ha ha ha ha ha.....now I know you're drunk or
stoked up on some bad wacky backy. You ever see my lab?

Hey, lemme give you a clue.....I try....I really *try* to go
along with the old adage of "if you can't say something good
about.....", so if I don't say something, it would be
extremely wise of you to not automatically infer that I am
nescient of it. There is a bunch of shit out there that I

choose to just not mention.

> > Another is the PRO-43, gone from the shelves now. Another

Why are you running off the deep end? It looks like you're
working your own self up. Or off.....

> > Do they have cellular? No. But then analog cellular is
> > almost a thing of the past anyway.
>
> Who cares about cellular?

You do. You care a lot. Obviously.

> Uniden and Radio Shack models don't have alpha-tagging.

Ummmmmm......they can be MADE so. <snicker>

> Don't have S-meters.

Ummmmmm......they can be MADE so. <cackle>

> Don't have bandscopes.

Ummmmmm......they can be MADE so. <snort>

> Don't have adjustable power savers.

Oh yesssssss some of them certainly do! <horselaugh>

> Don't have memory management features to copy/delete/move entire banks
> and channels.

Ha ha ha ha ha ha ha ha ha Ummmmmm......they can be MADE
so. Geez, are you ever out of it tonight. Did your momma
slap a booger outa your nose and make you eat it? Sheesh,
you're spoiling for some trouble,pal. That gap betwixt your
two front buckteeth is really beginning to whistle.

> And on, and on, and on.

No. Not on and on and on. You list each thing and let's
evaluate it on its own merits. Objectively.

> Of course Bill knows that the ONLY reason people get these
> radios is to listen to cellular. God forbid we might actually
> want a radio that has features today that no Radio Shack or
> Uniden will have for another ten years.

So? So we hack and modify and make it so. Big deal. That
way we don't have to promote smuggling and be accessories
after the fact and incur liability and responsibility when

some poor sap gets busted. And our entire community becomes more educated and more technically inclined. And more of our hard earned dollars stay in the community.

> The only person I see pissed off about importing radios is
> you. But since it is your cause, it must be proper and it
> must be just for everyone else to side with you.

Now I'm not sure now whether you're drunk, stoned, or just plain stupid. ALL our damn radios are imported, you ignoramus! I didn't say a thing about importing. How could you have read that I did....unless you're stupid? Or drunk? Or stoned? Or got bit on the arse by your own dog?

I talked of SMUGGLING, you dumbass! C'mon, get your shit together, man. At least talk some sense. I don't really care if you want to get a little personal, (I can fling shit, too, as you're fixing to find out), but at least stick to the germane, relevant, hard core facts in betwixt the insinuations and satire..

> > I do not believe my prior post was shortsighted at all,

Ahhhhhh, so the first thing you think of is his 'member'.

I see..... and so here you work yourself up a teeny weeny little erection (calling a toothpick a "woody") and pump yourself up to come tromping in on your magnificent white steed to take on the "Great Satan", eh?

I told you two can play!

Well, Mister Pompous Wells, you better stroke that puppy before you come bellying up to the bar. You've got a long way to go, Bunky. I'm ready for you *and* your horse, if you catch my drift.

But, I will *one time* urge you to stick to the facts and the relevant. You are free to argue anything I state....

....but why don't you consider callenging the issues; not the writer?

....or do you think you can spank me and increase your own stature?

I prefer the former but if you wish to play the latter, then
c'mon, c'mon, c'mon, Mister Wells. Let's see what you're
made out of. Let's see if you can outdo Mongrel Mackey.

One way or the other.

<rubbing hands together with great anticipation!>

<salivating>

<giggling & chortling>

<Hey bartender, grab the yardstick...we got us another live
one coming up on stage. Get the band to do a drum roll for
'im, will ya? He's a messiah fixing to save Society!>

Why not just by a CB(Ciziten's Band) Radio at a local radio shack. You don't need a license to transmit in the US and being actively involved in a conversation is a lot more fun than just listening to it...

Why don't you ask Grove why they are selling them at the price they are asking?
Yes, they are reputable without a doubt. Not the cheapest around, however.

For most Uniden dual conversion scanners I have to agree with the NO antenna idea, except at huge tracks like Daytona, Talladega, and Pocono. For others like my Pro-60, I prefer my Optoelectronics DB32 antenna. I frequently go to Pocono, Loudon, Dover Downs, and Stafford Speedway, which is a 1/2 mile track here in Connecticut. When I used to bring my BC200 to the track it used to get hammered by the MRN 454.000 feed. I don't know what you mean about 800 MHz though. According to my records, in Winston Cup only the 11, 21, and 27 use 800 MHz, while the predominant band seems to be the 460 MHz UHF area.
My headphone choice was the Diversified Electronics (Forest Park, GA. no website) / David Clark behind the head type, exactly the same as the NASCAR officials, ESPN, and most of the teams wear. Expensive @$125, but I barely have to turn the radio up at all, so I am very comfortable. A bonus that comes with really good noise reducing headphones is supreme battery life. My Pro-60 is good for an entire race weekend on one set of 650 maH NiCds if I'm set on a very low volume setting. I tend to get a lot of hits too, for I like to put the official's radios into the scanner as well as the drivers. My headset gets other use too, I use it while mowing my lawn. This protects my ears and lets me comfortably listen to scanners or a walkman, although the sound quality is kind of poor with music.

1496. PRO-2045 MODS ANY AVAILABLE

Newsgroup: rec.radio.scanner
Date: 1997-12-14 00:00:00 UTC
From: tyler@nospam.com
Message-ID: <670lcg$dl2$1@news3.microserve.net>
Source record: 177521

I recently bought the 2045 and am wondering if there are any available mods before I start my own mods to it. There is no external memory to the processor chip, so more channels are out. Full 800 Mhz range will be a bear because I will have to intercept the serial data going to the PLL from the processor and change that with something. (probably with a basic stamp or some other microcontroller) I could probably do a discriminator out fairly easily. What about an signal strength meter? I don't remember seeing an RSSI signal anywhere.
Any suggestions?

Tyler

How is recording (illegally) your roomamate going to tell you
anything about the phone calls, The phone bill will show you
everything you need to know about who he is calling and how long.
Also, in my area, you can tell your local phone company to block
(for free) certian numbers, area codes, etc.. this should stop the
problem.

I have have used Spectrum since it came out and was lucky to get in on the testing of ScannerBase. What I have found is with Spectrum is that you will get multiple listings of the frequency and user. I don't see that as much with ScannerBase. You can get some updates of ScannerBase from their web page, which is:
http://www.csp-tech.com. You also can download a sample copy to play with to see if you like it before buying. As with Spectrum you can do searches of Spectrum at PerCon's web page, which I think is: http://www.percon.com. I personally use the ScannerBase since you can customize the searches and data more than with Spectrum. As with anything that I have seen there is NO database that will be perfect for everyone.

I am surprised not too many people listen to Fast Food Places. It is not the orders that are interesting but the conversations between the employees. There are discussions about employees, the customers and even their personal lives at times. At times it can be quite interesting. I also listen to private security companies and railroads, plus the normal fire, police and ambulances.

Happy Scanning and Happy Holidays

From: ronkatz@interlog.com
Message-ID: <3498c01c.2975920@198.53.145.19>
Source record: 177532

Have two Pro2006 Scanners.

Both have cell mods.

One has switch in front face plate for additional 400 channels.

The Other has a screw hole and missing rubber feet on the bottom from
being mounted in a vehicle. But is newer and looks a bit better.

$300US each. buy both and I wll pay for shipping.

Please reply to ronkatz@interlog.com
or remove *nospam* to reply.

****
EQUIPMENT FOR SALE
****

Our company have the following monitoring equipment for sale:

3 ea. ICOM R-7100 (Factory unblocked versions)

3 ea. AVCOM Spectrum Display Monitor, SDM-42A, 10.7 MHz IF.

2 ea. DRAKE R8A Communications Receiver

The above equipment have been used in our engineering department for
RDT&E puposes. All units are in perfect, like new, condition, operations
manuals are also intact.

PRICES:

IC R-7100: $550.00/ea.
AVCOM SDM-42A: $550.00/ea.
DRAKE R8A: $550.00/ea.

Combination price of R-7100 and SDM-42A: $1000.00/ea.

All prices include Shipping&Insurance (UPS GroundTrack). CONUS only.

VISA/MASTERCARD ACCEPTED

If you are interested, please contact John at:

STRIDSBERG ENGINEERING, INC.
SHREVEPORT, LA, USA.

-> I would like to know how cellphones work, what frews they use and what would
-> the best way to find out what frequency a cellphone nearby is on??? Thank
-> you for your time and assistance.

Cell Phones work similar to a Trunking Radio system. There are
multipule frequencies assigned and they are Time Shared through Computer
control. the central computer also monitors signal strength of the cell
phone and changes Antenna sites as conditions require for moving cell
phone operation. They are assigned the 869.0 to 892.0 portion of the
old UHF TV band. As for knowing if you are listening to a particualrly
phone you can see it is difficult unless the owner of the phone dosen't
ming you listening in while you look at a Cell Capable scanner or
Frequency counter.

I would like to swap my AOR 8K for a Icom R7000. My 8K receives full 800, and has been recently serviced by Edco under warranty. Full documentation and original packing materials come with the radio. I hope to find a clean and well maintained 7000 with manual-mods ok, would like documentation on those. Am also interested in AOR 3000A/equivalent Military surplus type.
Ed

> >other bands?

In the US, there are (basically) two bands; the 800 Mhz band
and the PCS band at 1.9 Ghz. TDMA (not GSM) was deployed in
the 800 Mhz band using IS-54, basically because it would
fit into the analog plan better (narrower bandwidth vs.
GSMs 200 KHz). There's no need to bother with those restrictions
in the PCS bands, so GSM has generally been deployed there. Whether or
not this is 100% true or not I don't know, but one would have
to question any operator who deployed IS-54 TDMA into PCS
spectrum, since IS-54 has basically been a major flop.

> In North America, the only things permitted in the AMPS spectrum are
> things that can coexist with AMPS, that is D-AMPS, and AMPS. In theory
> at least you can put CDMA in as well by deallocating 41 channel
> blocks.

Uhhhh, *no*. CDMA is fully deployable in the 800 Mhz/AMPs band, and
actually, that's where it was deployed *first* (AirTouch in SoCal).
IS-95 was specifically designed to fit into that band, as "PCS"
wasn't even an option at the time. There are plenty of 800 Mhz
commercial systems around the US right now.

Can anyone tell me what kind of mod was performed on the PRO 26 to get it to recieve cellular freqs. If it is other than what is listed on my homepage.

1518. Re: PRO-2045 MODS AVAILABLE

Newsgroup: rec.radio.scanner
Date: 1997-12-14 00:00:00 UTC
From: Scott Gray <comm5@pacbell.net>
Message-ID: <34943031.9DB24A53@pacbell.net>
Source record: 177543

Tyler,

I own a PRO-2045, nice receiver - no cell mods (personally, could care less).

This "addition" or project will work with just about any FM scanner receiver. Your mileage may vary.....

The following modificaton/project is NOT for the newbie. You should have expereince with succesful component level debug. I accept NO responsibility if you blow up your scanner!!

My first concerns with my PRO-2045 was the "anemic" audio output and squelch tail timing. I have been succesful with the integration of a Motorola "Micor" series squelch/audio board. The Micor receiver has the famous "smart squelch". "Smart squelch" was a Motorola's 7909 proprietary chip that would eliminate the squelch tail on moderate to strong signals, leaving a longer "tail" for weaker stations and reducing and eliminating "chopping" as in closed squelch. The timing of the 7909 circuit kept the squelch open during the weaker mobile and HT's producinga nice quiet "click" at the end of transmision of the stronger signals (hysterisis timng)..... Much less fatiguing durng long listening periods.

Also the Motorola board took care of the weary audio of the 2045 by giving better than 10 ~real~ watts with nicely shaped and intelligible audio that could be heard nearly a block away! Using a GE or Motorola speaker of course. Clarity was vastly improved over the stock speaker.

Another nice feature was the ability to use the Motorola "PL" decoder, a plug in option board that was used in almost all of the Micors out there.

The PRO-2045 needs a discriminator out. I used 15k 1/8 watt resistor and a .1uf cap to pin 9 of IC3, (MC3361) to a RCA type jack. I also added isolated line for "decoded" PL tones (if your using the RS CTCSS decoder) by using a single 2N3904 switch for isolation to provide to the Micor board.

One drawback is that the Motorola board has excellent AM limiting keeping imupulse noise to a minimum, thus not passing AM Airband traffc.... So, for AM listening you have to use the existing volume and squelch on the 2045.

Disconnecting the Micor board (which is housed externally in a small R.S. project box) does not affect you 2045 for regular use - just enhances the heck out of its AF/Squelch.

Modification of the Micor AF/Squelch board was relativly simple. Add two 20K ohm Linear pots (squelch and volume) a resistor and a 9.1 volt zener diode. Some small quality sheilded cable fo interconnect and needed jacks and plugs. Your power to the Micor box should be about 12 volts at at least 1 amp for best

results.

You can find old Motorola Micor "drawers" for 20 bux and up at most swaps. It doesn't matter what band they were on. The audio/squelch section unplugs, toss the rest or scavenge for parts.

I can give details on the Motorola pinouts if you need them.

ANOTHER mod was to reduce or eliminate the background hiss even on the strongest of signals caused by sysnthesizer (common to the recent Uniden based scan receivers). Here, you must remove the cover over the synthesizer / front-end. Then, using a ferrite bead held by tweezers, I placed the bead over and around some of the synthesizer sections while feeding a strong unmodulated carrier to the 2045. I found a nice spot that gave better than 6db more "quieting" just a few inches below the 10.85 IF section (there is a small outline or box of unpainted etch) find the "spot" (Q-15) and secure the bead down wih a dab of hot-glue. Works! Did the same on my BC-895XLT with similar success!

Also, I added one more 10.85 IF xtal filter in series with the existing one on the 2045, reducing adjacent channel garbage without sacrificing sensitivity.

Yep, a little "deep" for most folks. DON'T do it unless you have the proper test equipment and can handle a small soldering iron. Be prepared to do a "touch-up" alignment on you finished product.

Scott Gray KD6CQ

Rich, Well said in all regards. I have owned the Yupi-7100 and there
is nothing here in the U.S. that comes close to it's performance (IMO)
, as you have noted in your reviews.

Normally I would have responded back to Cheek's senseless retort, but
it is clear that he is not mentally sound, and I am not one to take
advantage of the handicaped.

I hope he recovers from whatever is affecting him.

I was wondering if anybody has thought of a way or knows of a way to program a Uniden MR8100 with a Macintosh. If you have any thoughs or suggestions please send me an e-mail. Thanks for your help.

1525. Re: TALK GROUP LOCK-OUT PROBLEM

Newsgroup: rec.radio.scanner
Date: 1997-12-14 00:00:00 UTC
From: "S. O. Teryk" <Bud.Lyte@dark.web>
Message-ID: <671gpe$6qc@bgtnsc02.worldnet.att.net>
Source record: 177550
Cross-posted to: rec.radio.scanner,alt.radio.scanner

After reading the group for about 2 weeks now, I seen answers to a lot of my questions. And ---- this is probably not of any use to this particular question, but my scanner has to be in the regular scan mode, then press manual and THEN hold down the l/o button. Otherwise, it doesn't unlock.

Also, I don't see many questions/comments about the Rat Shack Pro 90 TrunkTracker... which seems to be a BC895 clone (??).

And, what is all the interest in Cell Phone listening? By that I mean that I've listened to portable phones, unintentionally, over the years and never found anything to hold an interest. Seems it would be like monitoring the excessive trash on CB radio. <g>

Question: is there a caculation for converting ID back into their frequencies? It seems to me that some of the ID's are 32 numbers apart. I've tried putting in a range of ID's based upon that numbering system and have, occasionally, found related ones.

From what I read here, the Pro 90 seems good enough for the normal range of police/fire/emergency/aircraft/marine monitoring. However, even though it does track some trunking systems here in the Puget Sound region (Seattle/Tacoma/Olympia/Everett). I can still take it back though, and spend my $300 on another brand.

Thanks for your input and consideration.

Maxx

1528. Re: Which scanner can you recommend me to buy???

Newsgroup: rec.radio.scanner
Date: 1997-12-14 00:00:00 UTC
From: Douglas Hinton <101723.2004@CompuServe.COM>
Message-ID: <#v8FXANC9GA.330@nih2naab.prod2.compuserve.com>
Source record: 177553

My advice is to avoid ICOM R-10. I haven`t found much use for mine. I programed 20 channels to search and it looked like it would take about 5 minutes to make one scan. I cut back to 3 channels, but its still slower than my Bearcat which is looking at 40 channels. Listening to frequencies in 6-18mhz only the very strongest can get through the rubber duck antenna and a long wire overloads the radio so that only garbage gets through. Besides if I wanted to use as a non-mobil broadcast receiver I would rather use a normal shortwave receiver. So its pretty much a flop as a scanner and a lousy shortwave receiver. Douglas

Source record: 177554

I considering adding a scanner to my 91 vette to ride with my valentine one radar detector. While cruising the net I found the BCT12. It looks to be about the same size of a radar detector.
Do any of ya'll have any experience with these? Can they really make a good scanner you can understand in such a small package.
Any suggestions would be greatly appreciated.

1536. Opinions on Second Mobile Antenna

Newsgroup: rec.radio.scanner
Date: 1997-12-14 00:00:00 UTC
From: Andy Ulrich <ulrich@null.net>
Message-ID: <671ope$auk@mtinsc04.worldnet.att.net>
Source record: 177561

I've currently got a PRO-2046 mobile, working off a RS glass mount antenna. My vehicle is a Jeep Wrangler with a soft top, so my antenna choices are somewhat limited. The antenna is okay ... not great on 800 MHz, especially when the vehicle is moving and causing antenna vibration, but it's acceptible for me.

I just put my old BC100XLT in the vehicle on one of those handheld cellular phone mounts. The mount sits low in the vehicle, and using the rubber duck antenna is awful. I want to use another antenna, and that's what I need opinions on. I have a glass-mount CB antenna on the other side of the windshield, so I really can't put another one on (the center of the windshield won't work, either, because of a vehicle mod).

The BC100XLT doesn't get 800MHz. My intended use is to hear public service in the 400 and 150MHz ranges. Some of my options:

a) Use the existing scanner antenna with a splitter; I know this will make my 800MHz reception even worse, and I don't like the idea.
b) Use my car radio antenna with a splitter; I can't imagine 400MHz will be any good that way, though.
c) Get the Grove No-tenna, which apparently "turns your vehicle into a wide-band antenna." Sounds too good to be true.
d) I could punch a hole in the hood or put a mag mount up there, but I don't like that idea too much.

Anyone have any comments on a) through c) from their own experience?

Andy Ulrich

Nicely put.

There's a reason that flamers like you-know-who hang around in support
and tech groups like this. If they went into any of the groups where
flaming is On Topic, they'd get chewed up and spit out in a heartbeat.
They'd rather disrupt the more civilized groups, where they get a lot
more attention than they would if they were merely another ChewToy for
the flame brigades to gnaw on for a day or two before going on to the
next victim.

Thanks for the compliment. I have not "fixed" anything in a long time, but it is nice to have someone think that I do. Regarding your question about why it is illegal, perhaps it is just part of the process of the US becoming more like the USSR of 30 years ago, with few freedoms. I know cell phones did not exist 30 years ago, but I am referring to freedoms in general, not a particular technology. Just my opinion on the subject.

If I recall that observation deck, you are behind some glass. You are not
in the open air. When you did your experiment, were you behind the glass?
I would imagine that glass would take a small part of the "punch" away.

1551. Re: BC9000XLT Keypad tricks ?

Newsgroup: rec.radio.scanner
Date: 1997-12-15 00:00:00 UTC
From: jtward01@aol.com
Message-ID: <19971215234100.SAA00911@ladder01.news.aol.com>
Source record: 177276

Uniden Bearcat 9000XLT - Keyboard tricks
(By Jeff Goldman, WA1UDB, with additional credits to Dave Rodriguez, Jeff Zeman and Bob Parnass)

By holding down the 2, 9 & DLY keys as you turn the 9000XLT on, you enter a sort of test mode. To do a "keycheck test" you can hit any key or turn the VFO knob either direction and the alpha display will tell you what key you're touching or which direction you're turning the VFO knob.
At this point, if you momentarily hit LOCK (to the right of the VFO knob) and one other button various things will happen:
LOCK & C - REPLACES ALL MEMORIES w/1300MHz and alpha-tags channels 1-250 with CH 00-249 in the display. Again, this will wipe out your memories!
LOCK & D - Checksum and Firmware Version Number.
LOCK & E - LCD Display Test.
LOCK & PROGRAM - Runs a short, continously-repeating demonstration program incorporated specifically for showing at the January, 1995, Consumer Electronics Show in Las Vegas. It also sounds attention tones as the message scrolls on the display! (Note that the word "scanner" is spelled "Scaner" in the demo program; it was too late to change this booboo that originated in Japan.)
The last three tricks will not wipe out memory. Only LOCK/C will do that.

The ECPA (Electronic Communication Privacy Act) of 1984 (and ammended
in 1994) make it specifically illegal to monitor cellular and cordless
telephone frequencies.

It is against the law whether you agree with it or not. It isn't fair
but it IS the law. They darn near have to catch you in the act to
make it stick (or confess to it in public with witnesses on, lets say,
A NEWSGROUP).

Nobody said it was a particularly well thought-out or ENFORCEABLE law,
but it IS a law.

1556. FCC regulations on antenna height?

Newsgroup: rec.radio.scanner
Date: 1997-12-15 00:00:00 UTC
From: jtatz@chemistry.ohio-state.edu
Message-ID: <882231165.1318715402@dejanews.com>
Source record: 177281

Does anyone know the FCC's regulation on height of scanner antennas?

Also, I have read that it is good to mount any given antenna high, in order to clear obstructions, however is there a certain height in which most things are cleared by that height?

Thanks,
-Jim

1563. Beware: Roy Valentine Scam Artist

Newsgroup: rec.radio.scanner
Date: 1997-12-15 00:00:00 UTC
From: xhduff@ica.net
Message-ID: <349525d5.0@lightning.ica.net>
Source record: 177288

In August 1997 I responded to an ad posted by a "BOBBY" VALENTINE
(bobby@netusa1.net) for an ICOM-IC756 "for sale or trade" on the
rec.radio.swap newsgroups.

A deal was struck to trade my TS850SAT, a power supply and some
cash for the IC-756.
I sent the TS-850, with the power supply and cash to follow.
Mr.Valentine did not send the IC-756.
In fact, it became evident that I had been taken when he had arranged
for the package to be dropped off at a neighboring business and an
unknown person signed for it.
Mr. Valentine denied receiving the package but once it was
estabblished through talking to a coworker that he indeed DID get it,
good ol' Roy accused me of various devious things including
unlawfully modifyiing the TS-850, undervaluinig the radio for customs
purposes (this would be to HIS benefit) ect..
In his mind, I did not deserve to have the radio back since I was
a "bad boy". He wanted money before he would consider seding it back.
Needless to say, I would not trust him at this point.

The bottom line is that he was out to scam me from the get go.
Roy Valentine is a smooth operator, there is no doubt in my mind
that he has done this before and will continue to under alias names.
His congeniality on the phone during our original contacts was
overwhelming, the phone call he made to my workplace in attempt to
defame me (to my superior) ended up being abusive.

The name he used with me was "Bobby" Valentine.
His real name is Roy Valentine of Galveston Indiana.

My misfortune was compounded with other personal family matters
that have been priorities during the past few months.
I could not devote much time to chasing down this SCAM ARTIST.

*** BEWARE of ROY VALENTINE of GALVESTON INDIANA ***

To direct any email replies please remove the "x" preceding my
address.

The FCC was going to pull their approval for sale of these radios in the U.S. It was at this point that the manufacturer did deem them unacceptable. I agree that they did not have much choice and that it had nothing to do with the quality of the radio's performance.
>
> I saw nothing in your quote of the California statute that is
> illegal in regards to selling these radios. These radios had
> never been sold. They were not defective. They did not and
> still do not contain second-hand parts(unless RS shipped
> them originally to dealers in illegal form).

It is a question of whether they are legal in their advertising (in whatever form) of these radios. They can, nevertheless, try to sell them for whatever they want. Is RS legally required to explain to their customers how they modified these radios? Did their modifications adversely affect the radio's performance? Do these radios meet a legal definition of "new" merchandise. Since I am not a lawyer specializing in this area I do not understand what the case law in California has defined as a "second" or a "blemish". Furthermore, each state and the federal Government probably have similar laws and case law which applies in this area.

P.S. - If RS was a little more honest with their customers (e.g. service manuals), we would not take so much time and effort to bash them.

P.P.S - When the PRO-26 was first recalled I e-mailed them to ask why? Their response was the the radio had not been recalled but had been discontinued for some time. How's that for honesty.

Message-ID: <674tuj$c1q$1@winter.news.erols.com>
Source record: 177294

Can ya help me? I own two radio shack scanners. I modified my Pro-39 to open up the 800 band, no problem.

I got another one, a Pro-2026: I want to do the same thing, and I found some text on how to do it. A piece of cake compared to what I went through with the Pro-39.

However, a friend of mine clipped the appropriate wire as directed on his Pro-2026, and the scanner scanned, but never stopped on a receiving frequency. He soldered the wire back, no difference, it appeared to be disabled. Totally useless scanner.

Is there any "safeguards" in this model that disables all functions if it is modified? Does someone have more detailed info on opening the entire 800 band on a pro-2026?

You will not experience the memory problems with a Nimh battery. One should be sufficient for your needs. Under that type of service, left on slow charge all the time, that battery should last about 2 years before any deterioration is noticed. I would suggest leaving the other one in the box until the original dies. It is not necessary to cycle a Nimh battery like a nicad, they tolerate being topped up without becoming lazy. My Nokia 100 is now 3 years old, the original Nimh battery (one only) is now shot, but went 2 1/2 full good years in daily usage, never died in a call, I never turned the phone off, charged it every night.

>
>It has come to our attention that entities are offering to modify
>scanning receivers (scanners) in order to receive frequencies allocated
>to the Domestic Public Cellular Radio Telecommunications Service. Such
>modifications are not permitted under federal law and the Commission's
>rules.

Sorry Paul, but I suggest you read the entire FCC release on this
topic, including where they (FCC) makes the distinction between
a someone operating a business to modify scanners (which they *do*
consider falling under the definition of "manufaturing") and an
individual modifying his/her own scanner.

The FCC specifically came out and stated that they were not targeting
individuals doing their own modifications. They did however go after
companies such as Grove who do offer modification services in exchange
for payment, and this is what they consider "manufacturing."

Please try again to cite the law which makes it illegal for a
hobbyist to modify his own scanner to receive cellular frequencies.

> fine but must be intact no cracks or burnt traces

the antenna went fast but I still need the rf board for the 300
a bc220 or 350 one would be ok too.

> breaking? Try "none".

Sorry, that's not right.
The law is very specific... such radios cannot be imported. The word
'imported' has specific meanings (look it up). Bringing such radios into
the US is illegal.
Having said that, I'll say this: the Customs people don't seem to be very
hot on actually enforcing this particular law, as far as individual
radios are concerned.
And it has nothing to do with being "personal property".
If I try to bring in, say, an AR-15, listed as 'personal property', it
won't be allowed in. The Customs people *ARE* hot on enforcing that law.

Strictly speaking, Bill's right. The law is specific. The fact that it's
not being enforced doesn't change that.

I'm not trying to start any pissing contest, but facts are facts.

If you want to use a scanner for HF use, there are really 2 choices
available. There is a mod available to the AOR-8000 to use the 4Khz
SSB filter on AM. Otherwise it is 12khz, and unless the antenna is
deaf (and most rubber duck type antennae are HF deaf), it is far too
wide. The R10 is also 12Khz, the Alinco JX10 is 15 Khz.
The other choice is Yupiteru MVT-9000. It has an N-AM mode which
appears to be 3-4Khz.

Unless you can get the AM bandwidth down to 5Khz or less, these things
give you lots HF AM to listen too, you just have to able to
understand 3 or 4 stations simultaneously...

I own an MVT-9000.

I do not believe this to be true. The manufacturer did not find
anything unacceptable about these radios. The FCC made Radio
Shack pull them. And they made it pretty clear what they had
to do with them if them if RS wanted to sell them and not
scrap them thereby "eating" the cost.

I saw nothing in your quote of the California statute that is
illegal in regards to selling these radios. These radios had
never been sold. They were not defective. They did not and
still do not contain second-hand parts(unless RS shipped
them originally to dealers in illegal form).

> Or am I wrong and is this stuff good??????

Hi Dieter,
Glad to hear you are making some progress! With regards to your
co-ax,
the 1/4" stuff is usually RG-8/X. Most RG-8/U is nearly a 1/2" thick.
But
there are MANY variations and it's hard to keep track of all of them.
But RG-8/U is pretty good. It all depends on how serious you want to
get. Sure you can do better but it will be getting into the law of
diminishing returns. You can put a lot more money into it but only
get fractional increments of performance improvement, if you get
my drift. Do some studying during the cold months to research what
might be better and the kind of costs are involved! Having done that
you're in a better position to decide if you want to go crawling back
up on the roof or not. ;-)
Happy monitoring with the new setup!

Actually, no, I don't work for Grove, and never have. I did sell several articles to Monitoring Times three or four years ago, and I am friendly with several of their staff members, but for the past several years I have been a columnist and contributing editor to Popular Communications magazine, a direct (but friendly) competitor to Monitoring Times. When I buy equipment from Grove I pay the same price as everybody else, and I have taken advantage of their return policy a couple of times when the purchases didn't work out.

Of course not! The cell phone frequencies are blocked on new scanners,
because they just want to try and take people's fun away, and that is the
only reason. Having fun is what is illegal.

That is subject to doubt and legal controversy.

> You can buy a Yupiteru in a foreign country and bring it back as
> personal property into the US...legally.

THAT is patently incorrect. The Yupi radios are not certified,
and therefore are not permitted under regulations. Furthermore,
if they receive cellular, then the TDDRA of 1994 expressly bans them.

The coup d'etat is your professing the legality of an illegal
matter, and you COULD become civilly or criminally liable for it.
Ask a lawyer, pal. Ask the FCC. Ask a judge.

> 3) I don't think I could believe someone that has driven a car, capable of

> and have never sped in their lives.

That has nothing to do with smuggling.

> I'm sure that this is the case with
> cell capable scanners and pocsag/flex/sca/etc. decoders!! :)

Cellular-capable scanners are banned..... SCA and other
decoders are not. Using some of that stuff is illegal.
Not the possession. However, possession of a CB linear
amplifier is illegal. Possession of the so-called CB
export radios is illegal. I'd bet the store that possession
of a Yupiteru radio is also illegal. You'd be a fool to
assert such possession is legal, when you are not a
lawyer. You could get pinched for aiding and abetting.
That's dumb.

> I know some ppl that have assault rifles fitted with night scopes,
> mega banana clips and certain modifications that use them for plunking
> prairie dogs and rolling coyotes. Are they legal? YES. Can they be used
> for illegal things? YES. Do they have to be used for illegal activities? NO.

You have a right to your opinion, but you are possibly leading others into commiting crimes. That takes it out of the "freedom of speech" realm and into civil or criminal liability.

> You can have/use a Yupi in other places besides just the good ol' USA

You can go live there, if it is an important issue to you.

> and you can legally bring them into the country.

No, you cannot. It's a violation of the TDDRA of 1994 (an Act of Congress).

> I didn't say import them...bring them in as personal property.

Not very smart, Wig. Importing and "bringing in" are the same thing. You are not allowed to bring heroin and other contraband in as personal property. Look up the definition of contraband. The Yupiteru radios are.....CONTRABAND.

And you certainly cold go to jail and/or be fined for smuggling one into the US. Ignorance of the law is not a legal point, you know that. What you may not know is ignorance on Customs part is not a legal point, either. How many people in this country went down the tubes after following something told them by the IRS? Customs can ignore your smuggling Yupiteru radios all they want. And the FCC or even the FBI can prosecute you for it...civilly or criminally, their choice.

You need to be sure of your assertions before commiting them to print, Wig. That's not a personal statement...it's for your own protection. The thing you need to do is avoid telling people it is legal to do something. ONLY a lawyer can do that. OTOH, you can tell people it is illegal to do something all you want. There is no civil or criminal liability for that.

I'm telling you this because I *know* it, Wig. I am not guessing or going on "logic" and "common sense". The law often strays from logic and common sense. Like this "personal property" and "importing" nonsense. You can't bring in Cuban cigars as personal property. You can't bring in Absynthe as personal property. You can't bring in explosives as personal property.

You can only "get away with" listing contraband as personal property. If you get away with it, then great! What if you don't?

The Yupiteru radios are illegal in this country by whatever means they come in, and that's all there is to it. The fact that a few hundred smugglers have been successful is not a mitigating circumstance here. Thousands of dope smugglers have been successful for every one that got caught.

Eh?

Sorry to burst your bubble, but on page 11 of the July, 1997 issue of
Popular Communications magazine, it mentions 2 Family radios talking over
100 miles from 2 mountain tops. But you had fun anyway, that is the
important thing.

That's a cop-out, John. 3mta3 has never asked you for a bibliography, unless I missed that post. He has only asked you to prove that you have made relevant posts. Several *other* people, now including me, are asking you to post a bibliography of your alleged publications. Why so hesitant?

I just called RS National Parts at 11:00 AM on Monday the 15th. I asked for the repair manual for the 2006. She looked it up and said the only manual they have is the user's manual...the one that comes with the radio. The repair manual wasn't even mentioned in the information she had. It didn't say "not available" or "discontinued." It simply doesn't exist in their computer anymore. It WAS in the computer last month when I tried to buy one, but it said "not available."
A month later it is available, but not in the computer. How convenient.

She is going to have the matter researched and someone will get back to me with details.

Any bets on what they will say? How about, "Gee, yes...we decided to sell the manuals, but darn it...we don't have anymore to sell. Sorry."

I wouldn't doubt that RS has said they will sell certain manuals that were previously "banned" in order to satiate the irritated scanner listeners, but the manuals will be conveniently "out of stock" or discontinued, yielding the same results as when they were banned. I also wouldn't doubt that there are a big pile of them stacked in a corner somewhere in Ft. Worth.

We'll see.

Andy

Okay, Mr. Fixit...why IS it illegal to monitor the cellular and cordless
phone frequencies?

Does anyone have a real, viable answer?

Think about it -

Bill

TIA,
EK

1611. FreeWare BC895XLT Scanner program (V1.3)

Newsgroup: rec.radio.scanner
Date: 1997-12-15 00:00:00 UTC
From: "A. Giammarino" <agia@ix.netcom.com>
Message-ID: <349574F3.DAB9716C@ix.netcom.com>
Source record: 177352
Cross-posted to: rec.radio.scanner,alt.radio.scanner
Body handling: Binary attachment payload not displayed: bctrunk.zip

*** Attention BC895XLT Trunk Tracker users
(Especially those in the San Diego area)

Attached is a freeware DOS application written specifically
for the Bearcat BC895XLT. Because it is freeware, you get
what you pay for. The program will not break your computer
or your scanner. However, you use it at your own risk.

The program only uses COM1. If you want to use something
else, I can't accommodate you (yet...). You may change the source
code. The included source code does run under a basic interpreter
such as QBASIC.EXE and it works. So you change the COM port if
you so desire. I suspect that only COM1 or COM2 can be used with
3 and up not being supported. Plans to build a cable to interface
with an AT style serial port (DB9) are at the end of this file.

So what does it do:

The program is somewhat described in the included source code.

After the radio is put into the trunk tracking mode and the remote
control feature has been activated (and assuming all frequencies
have already been entered into the scanner), BCTRUNK.EXE sends a
command to the scanner that tells it to send the received trunk IDs
out its data port. The program gets this trunk ID and compares it
to the list of trunk IDs and assignments that are contained in the
..DAT file that was read in by the program. If the trunk ID is found,
the following information is displayed:

Example:

(12) ID:000208 - Northern Dispatch

The (12) means that this is the 12th time that trunk ID has come up.
If the trunk ID is not found, then that number is displayed in the
unidentified trunk ID section. The program also alerts listeners to
unidentified trunk IDs by sending a 'BEEP' command to the computer's
speaker. On valid trunk identifications, the program asks the scanner
what the signal strength is and what frequency it came up on. When
the transmission goes away, the data is still displayed until another
transmission is received. At the bottom of the screen are the .DAT
files being used. To change .DAT files, the program needs to be
re-launched. All receptions are logged to a log file with the name of
your choice.

Included in the ZIP package are:

BCTRUNK.EXE: The program (V1.3), runs in either DOS or Win95.
BCTRUNK.TXT: The source code.
SANDIEGO.DAT: Trunk ID & assignments for the City of San Diego
HARTLAND.DAT: Trunk ID & assignments for Heartland Fire
ESCNDIDO.DAT: Trunk ID & assignments for the City of Escondido
README.TXT This file

Users outside the San Diego area will obviously want to write their own .DAT file. Just follow the format you see in the included .DAT files using a plain text editor. Sometimes existing text files can already be used. Using the search and replace features of a word processor can make the re-formatting much easier. You do not have to use the .DAT extension. Use any three letters you want.

Format:

six digit trunk ID - use leading zeros for IDs less than 6 digits
a single space
a description - any length but recommend 40 or less characters
carriage return and line feed

Example:

000100 Police
002002 Fire
etc...

When the program first launches, follow the instructions (put the radio in the remote mode) and enter the exact path of the .DAT file.

Example:

C:\SCANNER\CHICAGO.DAT

Note that under Win95, this DOS app can't accept long file names but the file can still be entered.

Example:

Instead of C:\MYSCANNER\LOSANGELES.DAT
Use: C:\MYSCAN~1\LOSANG~1.DAT

Look under the properties of the .DAT file to get the MS-DOS name if you're unsure.

If you make any mistakes, the program will likely crash as I didn't put in any error trapping. If you hit just a carriage return, the program will keep prompting you. Hit Control-Break if you must exit.

The instructions are the same for the output file. As of now,
the output file can't be disabled -- the program always writes
one.

A cable connecting the scanner's data port to the computer's
serial port is required. Here are the plans:

Cable information:

Connectors used: Female DB9
1/2 of an 8 pin DIP socket
(cut in half lengthwise)

Wiring: DB9 Socket
3---------------1 data into radio
2---------------2 data from radio
5---------------3

Pinout on BC895XLT is such that pins 1 & 5 and 2 & 4 are tied
together. Pin 3 is GROUND. Plug the cable into a computer serial
port and connect the socket end to the radio. Make sure that
whatever wiring convention you use, that the connections depicted
above are maintained (e.g. not reversed, etc...) I have my socket
end of the cable connected to the first three pins closest to the
AUX jack.
